Subject: [BCD396XT] Help with Programming Moto Type II UHF Trunked mixed analog/digtal system

The old 396 was easy...select UHF 400Mhz trunked, program and listen. I have tried programming the O Hare and Midway Airport UHF trunked systems in the XT and it scans/searches but doesn't stop on active talkgroups. I tried programming again. Aside from base, offset, etc., there is a 'enter lo' and 'enter hi' frequency section. Is that where I am going wrong?.... I thought that was only for rebanded stuff?....
Maybe I am not reading the manual correctly, but how do I program those UHF trunked systems....No, they are not P25 systems.

Thanks in advance

OK, thanks I will give that a shot when i get home this afternoon. Thanks for the quick reply Paul. Oh, by the way...You guys really hit a grand slam with this XT. It's a minor adjustment after mastering all the keys and functions of the 396T but this is the best product on the market in my opinion. It truly is. Thanks again!

It is for UHF systems, too. See:
http://info. uniden.com/ twiki/bin/ view/UnidenMan4/ Calculatingupper basefrequencies

(The spreadsheet on that page will calculate the upper base frequencies for you.)

2528. RE: [BCD396XT] Disabling all Start-Up keys

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-08-07 15:37:34 UTC
From: W4KRR
Topic: 2519 Message: 2528

One problem (to me) is the way it's implemented, unless I'm wrong.

Let's say I routinely scan systems 1 through 25, that is, I scan systems to which I have assigned System Quick Keys 1 through 25. Now, I go and create a Startup key number 1, where I only want to scan systems 1, 2, and 3. I press the 1 key while powering on the scanner. I'm now scanning systems 1, 2, and 3. Great. The problem starts when I want to resume the scanning of systems 1 though 25 again, like before. In my mind, I should be able to power off the scanner, and power it back on, and since I did not hold down a number key, I should be scanning systems 1 through 25 again. But no, it's still scanning 1, 2, and 3 only. There's no way to disable this. I have to manually go and unlock the remaining systems to get them back. And I don't always remember what systems are locked out and which ones aren't, so depending on the Startup keys assigned to what systems, I end up with a scrambled mess. It seems that once you use a Startup key, you're stuck with it unless you go back and manually undo all the changes it made.

I would like to see a key sequence where you press a couple of keys, and unlock all systems, and another sequence where you can lock out (or turn off the System Quick Keys) for all systems at once. You can do this with some of the software packages, but not directly on the scanner .

Ken

Subject: Re: [BCD396XT] Disabling all Start-Up keys

Startup keys do not affect System Quick Keys. They are independent. Startup keys lock or unlock systems based on what button you are holding down when you apply power. If you hold down 1 while powering on, all systems assigned to startup key 1 will be unlocked, all systems assigned to any other startup key will be locked out, and systems with no startup key assigned will not be affected.

System / Site Quick Keys do not affect a systems lockout status. To be scanned, a system' SQK must be enabled and it must be unlocked (two different things). It sounds like they system you have assigned to SQK 1 is locked out.

Sent: Friday, August 7, 2009 5:09:44 AM
Subject: RE: [BCD396XT] Disabling all Start-Up keys

That doesn't seem to be the way it's working for me. I just can't wrap my mind around the concept of System Start-Up Keys.

If I have start-up key 1, for example, that will enable (Quick Key) systems 7, 8, and 9, and nothing else, than that's good. But if I try to enable system Quick Key 1, it will not allow me to do so. I can see the system quick key icon number 1 changing from the number 1 to an asterisk and back again, but it won't scan it.

If I lock out systems 7, 8, and 9, I will get the "Nothing to Scan" message. If I press another System Quick Key, it still will not scan it, even though the system quick number changes to its assigned number from the asterisk, and back again as I toggle it. I have not locked out any other systems, yet they won't scan, only the ones assigned to that Start-Up Key will work.

What am I missing here?

Subject: Re: [BCD396XT] Disabling all Start-Up keys

Actually, when you start it up without pressing a Start-up Key, it retains the setting the scanner was in when you powered it down - including any Start-Up keys that were previously activated (unless you specifically disabled those systems after using the Start-Up key.

The only time the Start-Up Key is affected is when you press a different one. (again, aside from manual System manipulation)

If you would want to disable all Systems assigned to a Start-Up Key, you could simply have a Start-Up Key with no Systems assigned to it. That way, when you use it any systems assigned to any other Start-Up Key will be locked out, and all you will have active are Systems with no Start-Up Key assigned. This is different that what he asked, but is related.

From: Brent Gay
Topic: 2519 Message: 2529

I only use a single startup key for a few systems/sites that I want an easy option to enable/disable, similar to your example. When I want to turn those systems back on all I do is use a startup key that I do not have assigned to any systems/sites. Therefore, in my case I use startup key 0 to turn back on those systems/sites that I disabled using startup key 1. Hope that helps.

So far, so good.

As I said before, power cycling does not affect the Start-Up Key status.
The scanner will continue to operate as it did when you powered down
unless you press a different Start-Up Key.

> There's no way to disable this. I have to

Or press a different Start-Up Key.

> I would like to see a key sequence where you press a couple of keys, and

You want to use System Quick Keys, not Start-Up Keys.

Assign Systems 1, 2, and 3 to SQK 1, then assign some other systems you
want to work together with SQK 2, Etc.

That way, you will be able to 'mix-n-match' what you're scanning.

Start-Up Keys will not allow you to 'stack' multiple keys to enable
different Systems. They are exclusive rather than inclusive. By that, I
mean when you press a Start-Up Key, it locks out everything not assigned
to that Start-Up Key. The only way to change that, other than manually
unlocking Systems, is to press a different Start-Up Key. But, when you
do that all the Systems not assigned to the second Start-Up Key will be

locked out - including those assigned to the first one. Systems cannot be assigned more than one Start-Up Key.

Again, you want to use System Quick Keys. The scanner is operating correctly. You just aren't using the Start-Up keys correctly, and they won't do what you want them to do.

Joe M.

If the system on SQK1 won't enable, it must be locked out which means
it's assigned to a *different* Start-Up key other than the one you pressed.

Jeff, you will find us on FM mode. I use the APRS digi and the cross-band repeater on the ISS.

Very, very few hams use NFM mode. Maybe you saw NBFM mode which is what
99.999% of the hams use and is the industry standard term, but that is
what Uniden calls FM mode. So FM is the correct mode in a Uniden scanner.

Read WSR 096 closely, sir. Neither of my ISS radios (voice and digi)
are set for NFM.

You experts carry on.

Google "International Space Station 145.800". Most of the results/sites
reference the mode as "NFM", e.g. Monitoring Times, *Radio
Amateur*Satellite Corporation (AMSAT) members, etc. I originally
provided my
findings to assist a fellow group member. Additionally, its Interesting
that the Uniden BCD396XT offers (or perhaps just displays) NFM, FM, and WFM
as selectable modes. In any case, thanks for your additional clarification
Joe. I end this day a bit wiser!

The Uniden scanners do not 'just display' the various modes.

Here is a description of the various FM modes in use today:

Traditional Uniden Description
WFM (WBFM) WFM Wide FM - 75-100 kHz deviation - 200 kHz bandwidth
FM N/A FM - 15 kHz deviation - 40 kHz bandwidth
NBFM FM NarrowBand FM - 5 kHz deviation - 16 kHz bandwidth
SNFM NFM Super Narrow FM - 2.5 kHz deviation - 11 kHz BW

WFM is the mode used by Broadcast stations (TV and FM Radio), although Uniden also has the FMB mode that stands for FM Broadcast. Many wireless mics use this mode, too.

FM - very little left, but still used by the Military and Amateur Radio high end system links. In the 60s, the FCC mandated every Land Mobile user switch to NBFM. Most existing radio equipment was converted. Uniden does not support this mode in their scanners.

NBFM - What most Land Mobile users and virtually all Amateur Radio users use. In the 90s, the FCC announced a plan to switch Land Mobile between 136 and 512 MHz to SNFM by (and the year keep changing, but I believe is still 2013). Amateur Radio is under no requirement to switch.

SNFM - The newer systems that have come on the air with what sounds like lower audio when using a traditional NBFM mode. These are the only (legal) systems you will find on the VHF '7.5 kHz channels', and many but not all of the UHF 12.5 kHz channels.

I don't doubt that many Google links will have what you said, but there are very few Amateur Radios that have the ability of SNFM mode let alone use it. Virtually all repeaters still use NBFM. Again, maybe this NBFM nomenclature is being interpreted as Uniden NFM by some.

My scanner defaults to NFM but for everything I listen to in Michigan is in FM mode (800MHz digital, ham, public service etc) so after I program the scanner with freescan I go in and change all the bands back to FM: settings\band defaults\change each default other than FM broadcast and AM for air freq's. Sounds much better if you have the bands set correctly.

Mike

2543. Broadcasting Using Proscan

Yahoo group: BCD396XT (2008 — 2010)

From: Dan
Topic: 2543 Message: 2543

Ok so I'm totally new to broadcasting my scanner over the internet. I have ProScan and I downloaded the newest ver. that incorporates the ability to broadcast via ShoutCast or Icecast. Like I said I'm new to it and don't really know the difference or even where to start. Are there any tutorials, or people, out there that can help me get my feet wet?

I'd suggest that you post on the ProScan forum where you'll find a greater concentration of people with experience in doing what you are trying to do as well as lots of prior posts that may be helpful.

I had the same problem when I first tried to program the NSW GRN UHF omnilink system here in Australia. As soon as you add the lo and hi channel numbers it solves the problem.

Is there a way to just enter a frequency you want to monitor or do you have to program it?

Example: something just happened and you are told what frequency they are reporting it on. Can you just enter this frequency to see what's going on?

2551. Recommendations for New BCD396XLT Owners (Save Yourself)

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-08-16 03:45:51 UTC
From: John
Topic: 2551 Message: 2551

I hope this post finds you mentally sane. I hope you have not thrown the thing into the creek yet.

I have been frustrated for several days trying to make this new BCD396XLT useful. However finally I have hit the motherload and it is awesome.

But it came with a very high price in technological frustration. I could write a 3 page post of my pain points but I will instead stick with the FAST TRACK to "joy". Not that this is any indication of my "scan-aptitude" but I have an Extra Class Amateur Radio license and this was still a challenge.

Recommendations:

1. Do *not* try to get your USB to serial cable working on XP 64. It is just not worth the frustration if you have ANY other option. I could not get it to work and I have 20 years of computer experience. Perhaps it was a patience issue. I recommend you just go down the Best Buy and get yourself a SERIAL CARD for your computer. Forget USB to serial for XP 64.

2. Do *not* buy any other software for your scanner except PROSCAN. You can find it at http://www.proscan.org. I paid $50 bucks for another package the scanner vendor recommended. I tossed it. I just paid the $50 for the Proscan. Worth every penny. Believe it.

3. If you decide to NOT follow #2 - then good luck getting your USB to serial working. The *other* products have real problems indicating if you have a good connection, or ANY connection at all. You will fuss and fuss and waste countless hours thinking you have finally figured it out and then NO JOY.

I have not even cracked open the manual yet and my 396XLT is jamming.

One more thing:

4. All scanner software depends on a good database (list) of scanner frequencies. All scanner data files are NOT CREATED EQUAL!! Your scanner is worthless if you improperly configure the TRUNKS. You do not have a choice. You have to invest in the best data feed. HANDS DOWN, www.radioreference.com is the best. Forget Radio Shack. It is incomplete and barely better than useless. SPEND THE $30 a YEAR and subscribe to the Radio Reference Premium service. Proscan will then link directly to your account and you can really enjoy your scanner investment. The you will have a computer controlled scanner with a PC display so you don't have to mess with the clumsy controls on the handheld unit.

Do these 4 things and you will be pleased.
Worth every penny.

If this advice was on my Quick Start Guide I would have had this working 14 days ago.

Yep. Heard of many serial issues with 64 bit systems. Not the scanner's
fault or any reason to blame the scanner.

> 2. Do *not* buy any other software for your scanner except PROSCAN. You can find it at http://www.proscan.org. I paid $50 bucks for another package the scanner vendor recommended. I tossed it. I just paid the $50 for the Proscan. Worth every penny. Believe it.

There are several packages available. But again, maybe reason to fault
the dealer. Scanner SW is not the scanner's fault.

> 3. If you decide to NOT follow #2 - then good luck getting your USB to serial working. The *other* products have real problems indicating if you have a good connection, or ANY connection at all. I use serial. Works every time regardless of what drivers are on the OS.

> I have not even cracked open the manual yet and my 396XLT is jamming.

I think I may have an idea why you were having so much trouble with the
396...

> Worth every penny.

Agreed. Although the info is available without a subscription. Some errors and bad info, but by far the best thing out there. Some SW will even import the data without a subscription. Although RR changed their data format and discontinued the old format at the end of July, so please don't blame the SW authors for not having direct import ability working flawless as of August 1st (in RR's defense, I understand they published the change well in advance, however)

So, you've faulted the OS, drivers, and dealer. Where is the scanner the problem in all this? You started out appearing to blame the scanner for a lot of things that the scanner has nothing to do with and asking of others have "thrown the thing into the creek yet". I know I would like to see Vista thrown into a creek, as it has many issues that even have Microsoft stumped as to how to fix.

As for scanner operation, try 'cracking open the manual'. There is/was nothing in any Amateur Radio test about how to operate an XT scanner. I know it's not the 'guy thing' to do, but it's the smart thing to do. Don't expect the scanner to be like older non-DMA units. To paraphrase a slogan, "This isn't your father's scanner" and you can't just punch in a frequency into a channel and hit SCAN.

Joe M.

I know there have been a few replies to this already.

It is not a 396XLT unless you got a special model it's only a BCD396XT that most of us have.

Freescan is free(donations are nice)and works fine. There is no need for proscan or any other paid program. There were posts that Butel's program had stopped doing the import until another upgrade. You can't blame RR either.

Your computer experience apparently did not allow you to install drivers for a usb converter.

The other option would have been to purchase the USB cable. I would have rather than fighting with the computer. I use an older Radio Shack usb to serial cable and I have no problems.

As at least one other person said you cannot blame this excellent hobby scanner for computer problems. Most of us have had no problems. There was a learning curve and a lot of reprogramming with the importing but that has been overcome.

Maybe you bought the wrong USB-to-serial adaptor. They are not all created equal. I bought the expensive model - $17.00 - about 4 years ago and it works fine on everything I've tried it on which includes several models of Uniden radios, Garmin GPS, Pronto remotes, Brother labelers, etc.

As for scanner software, I've used Freescan from the beginning with no problems.

PS: I have only a General class amateur license (it's 54 yrs old) but I do have a full-featured USB-to-serial adaptor and Freescan. This combination seems to work for me.

Proscan does do a good job for unattended monitoring. But when you first get your scanner all you are interested in is getting the thing programmed. FreeScan is great for that and the price is right.

As GCR33 said. Don't blame the scanner for your computer problems. That's like saying it's Uniden's fault because you dropped the scanner in your garbage disposal.

I think the USB to Serial adapters either work or they don't.
Someone with less experience might get an error and give up because they are trying to use the wrong com port or baud rate with their scanner.

Topic: 2551 Message: 2561

Greeting JM.

[Clarification needed]

The scanner is outstanding and I do not have a single complaint about it. Not one. If I started from scratch I would buy the exact same scanner.

So to clarify for any reader who thought my use of the slang term "jamming" meant the scanner was actually "locking up"... I apologize. What I meant was since I stopped tinkering with the computer and purchased the necessary and sufficiently "user friendly" sofware, the scanner is producing output exceeding my expectations.

The BCD396XT is working very well. So that's what I meant by "Jam'in". Not Jamming. (laughing at myself).

Oh and as for reading the manual, my picture is beside the term RTFM in the metaphorical dictionary. That's actually again how I make my living is reading technical manuals and delivering services. I will indeed read the manual on this device.

However after you cut loose of nearly $700 dollars (3rd party software included), you need some immediate gratification. The time is ticking on your option to return the product so it is imperative you preceive value in the transaction as soon as possible. It does you no good at all to own an expensive receiver and not be able to get "useful" output from it. No matter who is to "blame". As the buyer of this "output" I don't care about why I have "no joy". I just know I am out $700 bucks and as each day goes buy I get closer to the Return Authorization call.

So since the entity holding the most risk in the "transaction" cyle is the vendor, then I maintain the vendor should do a better job finding ways to ensure the buyer gets their necessary immediate gratification. Hence the term VAR. If I was the vendor, I would test drive every available SW package and then have it "QA'ed" by a 12 year old child. If the appropriate 12 year old cannot get it working with "useful" output, don't recommend the SW. If all the software sucks you better open up a "live" help desk.

And for the record the SW that was "sold" to me during the purchase, did *not* detect or make use of the *properly" working COM port 7. I lost 3 hours messing with it. I still have an open "email" -based support ticket open with them. Even at the loss of $50, I still see it as "relief" I do not have to deal with that support issue now.

Sage recommendations and insight JM> Thanks.

The basic problem with USB is they need drivers.

Each new OS may or may not be supported by the available drivers, and
that's why a driver may work fine on one PC but not on an identical one
with a different OS or combination of SW installed.

Another problem is that the port number will change when plugged into a
different USB port, and sometimes even into the same port.

But certainly the port speed and number settings are necessary.

That's why I like RS232 - same port number every time and no drivers
required, hence no issues with having the correct drivers or the
associated compatibility problems.

From: MCH
Topic: 2551 Message: 2568

Oh, and I forgot another big problem with USB. If you have Windows, you likely have automatic updates enabled. Any of those updates could 'break' your USB drivers, so your USB devices could stop working at any time until you update the drivers for the USB product to regain compatibility. If it's a product that is no longer made, updated drivers may not be written to support your newly updated OS.

It's ironic that RS232 serial ports are more universally supported then Universal Serial Bus ports. RS232 is a standard spec that doesn't change and doesn't rely on software (drivers) for compatibility.

The most reliable USB - Serial Adapter that I have found is the Keyspan. I got mine from Amazon but others have them. I have not found a scanner or radio yet that they will not program.

I agree, the Keyspan works with XP, Vista and Windows 7, including 64 bit versions. It is an excellent priduct.

I have had perfect connections with a I/O Gear GUC232A USB to serial adaptor.
Go here http://www.shopiogear.com/detail/IOG+Z-GUC232A
just Google. Also here
http://www.cyberguys.com/product-search/?keyword=guc232a
About $15 to $20 bucks.

>

By George, I think he's got it!

You are right. Uniden does NOT yet have software for the 396XT and the 396T software will NOT work on it. Personally I use FreeScan and it works just fine for me. Fortunately every computer I use (both home and work) have real serial ports so I don't have to worry about USB conversion.

<soapbox mode>
I personally think that USB is not really ready for primetime.
There are just too many problems with it.
A real serial port just WORKS.
</soapbox mode>

Fortunately getting real serial ports is easy on desktops (either built in or on a card), but I know that one of these days I'll end up with a laptop that does not have serial. I guess that's one advantage of my old Dell laptop at work....

2574. Corrupt memory?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-08-17 03:48:44 UTC
From: agcme2002
Topic: 2574 Message: 2574

Hi all,

This afternoon I suddenly stopped being able to hear a couple P25 systems programmed into the scanner. I hadn't even touched the configuration beyond changing the backlight color. I tried to download the config using FreeScan and even that can't read the radio. I may have to do a full reset but I can't find it in the manual and Google isn't being much use (every page I read says "just reset" but never says how).

2575. Re: [BCD396XT] Corrupt memory?

I can't say for sure that this will work with the XT since I don't have one, but, all of Uniden's trunktrackers that I've had since the BC235XLT required holding the [HOLD/MAN] [2] [9] keys together while powering on to do a complete radio reset.

Is it possible that the system you are monitoring has rebanded? Most systems that use 866 thru 869 MHz. have been reprogrammed (or soon will be) to the 851 thru 854 MHz. band. If you can program the radio manually try to change any 866 to 869 MHz. channels exactly 15 MHz. down, for example, if one of the freqs is 867.4125 change it to 852.4125.

I suspect that you might have some sort of driver or com port issue causing you not to be able to read the radio. Check the com port before resetting the radio.

It would help to have a location/system reference from Radioreference.com, but if it's a true P25 system, rebanding shouldn't be a problem. The bandplan is identified by the control channel data and populated in the System bandplan table automatically.

If it's a mixed-mode system then I agree it could be rebanding and you will need to reprogram your system and adjust the custom bandplan table:
http://info.uniden.com/twiki/bin/view/UnidenMan4/EditBandPlan?sortcol=table;up=#Rebanded_Motorola_Systems

I had a similar problem with my XT that I posted on this site but received no replies.?The scanner was trunking?a local P25?system and for no apparent reason it stopped. It was going through the motions however it would not stop on TG's and it would not lock onto (seemed like) the control channel. After checking and rechecking everything I could think of I turned the scanner off for about 5-10 seconds and turned it back on. The problem seems to be fixed. Have you tried that?

If the control channel was rebanded and not programmed in the radio there
would be no way for the scanner to track the system.

Not so....if the control channel moves, your radio will not be able to monitor the system until you program in the new control channel.

--- Original message from <dmccorm@...>: ---

It would help to have a location/system reference from Radioreference.com, but if it's a true P25 system, rebanding shouldn't be a problem. The bandplan is identified by the control channel data and populated in the System bandplan table automatically.

If it's a mixed-mode system then I agree it could be rebanding and you will need to reprogram your system and adjust the custom bandplan table:

I have 2 XT's and have experienced the same thing on both. Fortunately only once on each scanner. It has nothing to do with rebanding. Note that you cannot read the radio from your PC which leads me to believe it is a software glitch. In both cases I was able to turn the radios off for a short time then turn them back on and everything was fine. I contacted Uniden about the problem and they wanted me to return the radios to their service department. Since it only happened once on each radio I decided I would live with it for now.

It's been several months since this occurred but I believe I could still hear the traditional FM stations OK.

Do you have a database entry from Radioreference or a location of these systems? Perhaps the database will tell you if the system has been rebanded or not.

Nope. I run the UHF Motorola SmartZone (not P-25 - yet) system he had
trouble with for a living, and we did nothing with it this past weekend.
He had posted the system on another list.

Good to know. Now, maybe the memory became corrupted using FreeSCAN somehow? Maybe if the system was erased and then reloaded into memory again it would help. If not, I would do an initialization of the 396XT and start fresh to see if it occurs again.

Hi this is my first post in this group...i have a new 396xt with the latest firmware and i get this wierd little sshhh noise when i listen to LAPD P25 it only happens sometimes when they key up. Its not decoding noise its very quite its not the same volume as the transmission and it only lasts for like a second does anyone else get anything like that?

Its wierd on my 396t i started getting this noise when i turn systems on and off after upgrading to the latest firmware.

That's it, it worked just fine.

It's not in the one supplied on the CD with the radio itself which is what I was looking at. But the reset worked.

That was the same problem with mine. I could hear the conventional systems with no problem but I could not hear any trunked system. As long as I keep a configuration back up I'll be ok. If it crops up again, I'll call Uniden.

It was going through the motions however it would not stop on TG's and it would not lock onto (seemed like) the control channel. After checking and rechecking everything I could think of I turned the scanner off for about 5-10 seconds and turned it back on. The problem seems to be fixed. Have you tried that?

Tried that but it didn't help. Clearing the radio completely has fixed the problem.

No, the trunked system is on 450 Mhz.

> I suspect that you might have some sort of driver or com port issue causing

Com port works fine. I use it every day for other tasks. The software simply would not read the radio, timing out frequently or receiving corrupt data even though the port itself worked for two other serial devices. A reset of the scanner cleared the problem. I already had a backup of what I had programmed so I didn't lose much except a couple minor configuration changes.

It wasn't a rebanding problem (the system is 450 MHz). It was simply a corrupt memory issue. All is well now. Having a back up of the memory is a useful thing.

Yes, I didn't bother posting the system specifics here because I didn't really think the specific system was vital to the problem and, after a bit of fiddling, I suspected a memory corruption problem instead. It appears I was correct.

I was not able to rewrite the single system because there was a couple corrupt bits in the memory that cause CRC failures. So I wiped the radio and started over with my backup of the configuration and it worked fine again.

<Larry are you still having this problem or did it go away?>

I haven't seen the problem again for a couple of months. I figure it's a software bug that only occurs under certain circumstances. Eventually the factory will figure it out and it will be fixed in a future release.

I think this is part of the problem. I too was looking for RESET. Who would have thought of "Initializing". A good term but not the first one that comes to mind.

This problem of different names for the same item is though out the Uniden and external software world. A thorough and complete glossary would go a long way toward helping this problem but I have yet to find that either.

From: markspoo
Topic: 2600 Message: 2600

HELP: I have the obvious 396xl scanner. I am at my wits end with the quick keys. Can someone put how to use them into plane english. I am using the Butel software pro edition for programming.

Thanks in advance

2601. Re: [BCD396XT] Programming and Understanding Quick Keys

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-08-19 02:29:45 UTC
From: Richard A. Victor
Topic: 2600 Message: 2601

System Quick Keys (SQKs) allow you activate and deactivate systems
for scanning. The single digit SQKs are toggled between active and
inactive by pressing the corresponding key on the keyboard. The two
digit SQKs are toggled between active and inactive by pressing the
./NO key followed by the two digits on the keyboard.

The display

S0:1234--7**0 indicates that SQKs 1, 2, 3, 4, 7, and 0 are active;
SQKs 8 and 9 are inactive; and SQKs 5 and 6 are unassigned.

S1:12---678** indicates that SQKs 11, 12, 16, 17, and 18 are active;
SQKs 19 and 10 are inactive; and SQKs13, 14, and 15 are unassigned.

Etc. to S9:12345678790

There can be more than one system assigned to a SQK.

Each system can have up to 10 Group Quick Keys (GQKs). The indicator
for the GQKs is the line below the SQK line and works the same way
except that it only has ten possible values and therefore is only
single digits.

GQKs can be toggled active and inactive by pressing FUNC and the
keyboard number while the scanner is scanning the particular system
which contains the groups that you are controlling.

It makes no difference which software you are using since SQKs and
GQKs are a function of the scanner. The software can, however, set
the initial state of the SQKs and GQKs.

Hope this is helpful.

Dick

Look in the FILES section of the group for a file called SQKmap.xls. I think I put it here. If not, look in the BCD396T list.

It also explains how I assign my GQKs.

It explains a very easy way to program and remember your SQKs.

As for using them, it's just like the old bank'ed scanners - press a number on the keypad to enable or disable a SQK. For two-digit SQKs, press the . button first than press the two-digit SQK.

For GQKs, just press the FUNC button while on the System you want to enable/disable the GQK in question, then press 0-9 depending on which GQK you want to enable/disable.

For all these, you must have first assigned the GQKs in the Group Options or assigned the SQKs in the System (for Conventional) or Site (for Trunked) options.

Oh, and I forgot another big problem with USB. If you have Windows, you
likely have automatic updates enabled. Any of those updates could
'break' your USB drivers, so your USB devices could stop working at any
time until you update the drivers for the USB product to regain
compatibility. If it's a product that is no longer made, updated drivers
may not be written to support your newly updated OS.

It's ironic that RS232 serial ports are more universally supported then
Universal Serial Bus ports. RS232 is a standard spec that doesn't change
and doesn't rely on software (drivers) for compatibility.

Yea, and when you complain to the vendors, they say "just buy an adapter". Well, I have many applications that will not work on an adapter (and never will). They require the real McCoy.

And I just recently got into programming PICs. Guess what; Another application that requires a real COM port with voltages that are within spec. Compromised port voltages won't work, and adapters won't work.

Fortunately, all my PCs have COM ports. I won't but one without them. If you look hard enough, they are still out there. But they are getting rare.

At least for the desktops you can buy a real port card.

Not so! My Toshiba Tectra A-10, which I configured direct from Toshiba about 6 months ago, came with a standard, built-in serial port! It's a high-end laptop which also has 3 USB ports and 1 eSATA port standard along with a plethora of other features...both standard and optional. Their prices are excellent as well.

2609. Setup Band Scope

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-08-23 04:16:02 UTC
From: spacezephry
Topic: 2609 Message: 2609

Hello,

Need some help setting up Band Scope mode. I am not following my printed Uniden Twiki pages. Text information isn't great. Any comments welcome.

Thank you,

Greg

2610. Illinois StarCom 21 Programming Question

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-08-23 00:41:03 UTC
From: BDR431@aol.com
Topic: 2610 Message: 2610

Trying to reconcile info already programmed in my 396XT (07/12/2009) against RR data for StarCom 21 (as of 08/20/2009) and the updated CARMA page for McHenry County, IL:

?

I have the following StarCom 21 Sites under the same System (SQK1):

Lake County?Simulcast (1-008)

Chicago North Cook (1-015)

McHenry County (1-020)

McHenry County Simulcast (1-046)

?

The following Groups are:

McHenry County (Quick Key 1)

ISP District?15 (Quick Key 2)

ISP District Chicago (Quick Key 2)

ISP District 16 (Quick Key 2)

ISP District 2 (Quick Key 2)

?

Software Settings (ARCXT Basic, Version 1.1, build 4) for Lake County Simulcast and both McHenry County Systems:

?

Quick Key: 1

Start Up Key: None

Hold Time: 0

P25 Wait Time: 400

Attenuator and Lockout not checked

Modulation: Auto

Control Channel Only: Not checked

Mot Bandplan: 800/900 Standard

Edacs: Wide

?

Trunk Freq Info (Frequency #0, #1, #2)

?

Lake County Simulcast:????? 866.4625?? 855.2375?? 867.9375????? LCN Left Blank, LockOut set to 0

McHenry County:????????????????? 867.4125???867.9125?? 868.4375????? LCN Left Blank, LockOut set to 0

McHenry County Simulcast:?851.7375?? 852.5500?? 853.0375?????LCN Left Blank, LockOut set to 0

?

I'll have to add (to the McHenry County Simulcast?System (site 1-046) 851.3500 and 853.3125, per CARMA profile.

?

I modified the?Talkgroup info?08/20/2009?under the McHenry County Group from talkgroups 1101 and 1134 to 1101-1167 (per CARMA profile).

?

Other than adding the 2 additional frequencies to the McHenry Simulcast?System (site 1-046), do I need to make any additional changes?

?

Thanks in advance (and thanks for the bandwith!)

?

Brian Riley

McHenry County, IL

That bandscope feature is TOTALLY awesome! I ran into it by mistake.
Showed up like an oscilliscope. If someone finds out let me know or
run the Uniden CD Scanner Users Guide.

Not sue but I have been led to believe you should have any simulcast system as it's own system. The scanner works much better that way. For St Clair County (metro St. Louis) we do that. Seems to work OK. Just a suggestion.

Topic: 2610 Message: 2615

First of all these Sites should be programmed as P25 Standard, they won't work properly if they are set to Motorola.

Second, each of the 866-869 MHz. sites in the Chicago area have been rebanded to 851-854 MHz. Any freqs you have in the radio between 866 and 869 should be converted to 851-854.

I should have the latest version of the CARMA Profile out this week, it lists all the rebanded freqs.

As for the talkgroup lists, if you "Search" instead of "Scan" trunked systems then you will hear any traffic on the Site, those you have programmed in the radio will show the tags you entered, others will just show the TGID.

You should also have Control Channel Only mode turned on, but TTTT I am not sure it matters on P25 systems, I think the radio ONLY works in that method regardless of the actual setting. Unless the additional channels added to a Site are Control or Alternate channels it would matter if you have them in the radio.

2616. C-CH Output vs C-CH Only & Band Plan

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-08-24 02:24:21 UTC
From: SRehm24416@aol.com
Topic: 2616 Message: 2616

What is the difference? I am not sure what and when I should use C-CH Output.

I also have a P25 system that under select site has Edit Band Plan. It currently shows ...

Select Plan

0:851.00625/6.25

1:762.00625/6.25

2 thru 9 are blank as well as A thru F.

The system uses only 800MHz freqs. What should it be set on? And if I am listening to a multi site system (P25) and it has 800 and 700 MHz freqs. Do I set each site to match the plan?

C-Ch Output allows certain trunked control channel data to be made available
at the serial port to be used by programs like Pro96Com in order to decode.
C-CH only allows the radio to monitor certain trunked systems to be tracked
when you only have the current Control Channel in the radio, thus you don't
need to know the voice channels.
Band Plans are not needed for P25 systems, including 800 or 700.

Leave C-CH Output off (unless you are analyzing the data using PRO96COM or similar).

Leave the band plans alone. 99% of P25 systems automatically fill in that data (if you change it, the scanner will just change it back as soon as it gets the correct table off of the control channel). The 1% that don't are a few military / DOJ systems ...

Your talking about two different things here. Control channel output is for trunked decoder programs. The XT's can use Pro96Com (for P25) and Trunk88 (for Motorola systems). It's not needed for the XT to track trunked systems only to output data to the serial port from the radio.

Control channel only is for the XT to track the P25 or Motorola system using the control channel only vs. all the frequencies in the trunked system. Currently it's the only option you have with the latest firmware version.

If your 800MHz P25 system is rebanded it should be fine. The XT uses the data from the control channel on P25, you should not need to do anything if it's a true P25 system as opposed to a Motorola Mixed-mode system. Even though the table is populated with 700MHz alternate bands listed, that is correct even if 700MHz frequencies are used or not for that system.

I would only want a system or individual channels set digital or analog. Which is what I believe the OP intent was referring to, don't you think?

Example. In Indiana SAFE-T there are a handful of analog talkgroups, but the towers I listen to, usually in travel, are all P25. It would be helpful to assign digital to that System. Maybe even set the analog channels to analog to override the system setting would be better. This way you have a much better chance of not hearing motorboating. If you plan ahead with the software as you mentioned, this can be changed quickly, but the option of a global setting (with possible override on a channel) on system settings would be helpful.

That would be 'system-wide' which I could see.
Global would mean every channel in the scanner.

Anyway, all these are easy with software.

2634. RE: [BCD396XT] Can "Audio Type" be set globally ?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-08-28 16:58:20 UTC
From: Dan Danz
Topic: 1648 Message: 2634

Let me clarify this *feature request* as I understand it:

1: The channel audio type would have a new value: “Default” so the choices would be “Default/Auto/Digital/Analog”.

2: New channels would be created as “Default” rather than to Auto.

3: Each site in the system would have a new parameter “Default Audio Type” .

Settings would be “Auto/Digital/Analog”.

4: Site “Default” itself would default to “Auto” to maintain status quo. This would mean that newly programmed systems would still work, but possibly suffer from BRAP if a digital channel was left at auto. If the setting was changed to anything else, any subordinate channel that was set to “default” would immediately inherit the new site setting without further changes.

5: Existing channel Audio Type values would be retained if set. To accommodate the new feature, a user could make a one-time change to existing channels to set them to Default to take advantage of the new feature or could just leave the channel set to the correct value. The feature would be primarily advantageous when creating new TG/channels on the system.

For internal radio firmware programming, needed changes seem minimal. When the scanner is about to decode audio, it presently has to look at the channel data to determine audio type. Under the new scheme, it would still do so, but if it found a “default” entry in the channel, it’s a one-step indirection to look at the SITE default audio type. Memory wise, it adds a byte to the site data structure. Otherwise, everything stays the same as today. It shouldn’t change decode time more than 1 or 2 microseconds.

For the programming software, like Freescan/UASD/ARC etc., it adds a field to the site programming panel and an additional permitted value to the channel audio type. And it requires the addition of an additional parameter field to the site programming command that gets sent to the radio.

HOWEVER: given that it’s pretty easy in a lot of the scanner programming software to select all channels in a group and change their audio type in one fell swoop, is this change necessary?

From: dmccorm@charter.net
Topic: 1648 Message: 2635

Actually the best method would be to have the radio "automatically" change to P25 on a mixed-mode system without missing the fist part of the P25 data, but it doesn't work all the time. This is why we would even need the "audio type" feature to begin with.

The 396XT works much better on mixed-mode systems than the 396 classic, but is still not as good as the RadioShack PRO-96 or GRE PSR500 in automatically switching to P25 when detected.

Third party software or not, we either need a better method of selecting the System or Channel setting for digital, or an improved method of decoding digital on mixed-mode systems.

Actually, it would just be a matter of changing the AUTO default setting
when creating a channel to whatever you have set as your default mode.

If that were to happen, it would have to 'switch back' for analog and
you would have the same complaint about analog transmissions which are
much more often the case on 3600 systems. It's also easier to decode the
presence of P25 than it is to "decode" it's absence.

Hi there

I just have a couple of quick questions, does the close call setting work to pick up any signal? And what kind of range does it have, thank you in advance!

The main problem is motoboating on P25, not analog. Fix that problem, and the whole issue of what and how to select it goes away. We've been addressing this from day one on the 396 classic, it's now better on the XT with more options, but not the best it could be.

If it's a P25 system, it should be set to DIGITAL ONLY and the
motorboating problem should disappear.

"Mixed mode system" digital only talkgroups. True P25 systems are fine.

Like the P25 system TGs, if the TGs are digital only, setting them to
DIGITAL ONLY in the programming should eliminate any motorboating.

The only time there should be any problem is for TGs that use both
analog and digital, and there are darn few of those around.

2644. Resuming scanning after a timeout?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-08-30 20:28:39 UTC
From: agcme2002
Topic: 2644 Message: 2644

Is there an option somewhere to force the scanner to resume scanning after a period of time? The idea being I want to be able to scan around a block of frequencies even though a few of them might have local sources of interference that cause the scanner to stop there until I manually resume the scan.

2645. Re: [BCD396XT] Resuming scanning after a timeout?

Topic: 2644 Message: 2645

There's Data Skip and/or Negative Delay times that could apply.

Joe M.

I don't think that Data Skip is implemented on the XT. Negative
delay should work though. Here's what the Users Guide says:

Set Delay Time
Set the number of seconds the scanner should wait after a
transmission stops before
moving on to the next channel. Select 0, 1, 2 (default), 5, 10, or 30 seconds.
To have scanner leave the channel after a designated number of
seconds whether the
transmission stops or not, select one of the negative values. Choose
-10 seconds to have
the scanner leave the channel after 10 seconds even if the
transmission is still going on;
choose -5 seconds or -2 seconds to have the scanner leave after 5
seconds or 2 seconds,
respectively.

That was it, thank you. I didn't even notice the negative values in the selector list. Now scanning's a bit easier and I don't have to reach over every few seconds to bump the control knob.

You can't scan like the old Uniden hand helds. You must learn how to program the new way. Once you do that it becomes somewhat easier. Program your system. Then program your group. Once you have all the frequencies in (assuming they are analog non-trunking) you should be good to go. I know this is a basic answer but read, then re-read, the info on the CD Rom.

It appears that Wilmington FD is primarily on the state's digital system which is listed here:

http://www.radioreference.com/apps/db/?sid=411

Some of the fire channels are patched to varous conventional frequencies as shown here:

http://www.radioreference.com/apps/db/?ctid=313

While you could program both aspects manually from the keyboard, as a practical matter you'd be better off downloading one of the programs that allows you (with a premium subscription) to download the data directly from RadioReference into the program and then to transfer it to the scanner. FreeScan is a good choice for software to do that.

If your computer has a serial port, you're all set. If not, you need to get either a serial to USB adapter or the Uniden USB-1 cable which includes the adapter as part of the cable. In those cases, be sure to install the driver before connecting the cable.

If you choose to not get a RR premium subscription, you can use the EZGrab feature in FreeScan to import the data via the computer clipboard or you can type it in.

Unfortunately, doing all of this the first time can be a bit daunting. Take it one step at a time and come back if you run into any problems.

It's not that simple anymore. Per www.radioreference,com ,they now use a statewide public safety
Motorola Type II SmartZone trunk system. Go there for the info. and as someone suggested, use Freescan to program your 396XT. For Freescan go here http://scannow.org/
I doubt if the older Unidens could properly track this system. The 396XT will. You have a lot to learn but don't give up and don't be afraid to try.

I forgot to add, if trunking is new to you, go to the forums in
radioreferencecom and read and read and read some more.
Also just Google "radio trunk system" there are several types.
We're here to help, but you have to help yourself also. Good luck.

Actually, it's not that it's digital that makes it more complex, but rather that it is a trunked system rather than the conventional channels that you were probably used to with you previous scanner. Once you learn to use software to program the scanner, these things will become routine and easy once more.

If you press HOLD while scanning that system, you should hear the control channel (if you are within range and the correct frequencies were programmed). You'll also see information as channel grants are issued on the system. You should also make sure that system is programmed as a Motorola Type II system.

Hello,

How far are you from Wilmington? Usually, the system is hard to hear the further you are from City. The Tower is located at the reservoir.

2659. Search/ Close Call Lockouts

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-03 14:45:29 UTC
From: Michael Bennett
Topic: 2659 Message: 2659

The manual indicates that locked out frequencies are skipped in search & close call mode and that lockout information is common to searches & close call.

Does this include conventional frequencies that were preprogrammed in lockout or subsequently locked out or just to those that were locked out while in search or CC?

It does not include any frequencies programmed into channels, regardless of whether they are channels in factory programmed systems or systems you create yourself.

You're seeing the technical info for the digital decoding as well as the
bit error rate.

For encrypted transmissions the scanner ignores them.
No sense in sticking on a channel you cannot hear, right?

Think of it as a digital s-meter.

On a perfect signal the scanner will accurately decode every bit sent.

As the signal gets weak, it may miss some bits. Let's say it's decoding
9 out of every 10. The ERR rate will be 90% (which is really an
anti-error rate, but we won't go there). At this point, the error
correction should still be able to fill in the missing pieces.

The weaker the signal, the less bits that are accurately decoded. Around
60% or so you will notice that there are so many missed bits the error
correction cannot compensate and the signal will 'go digital' for the
most part.

If your ERR rate is down to 10%, there isn't enough data left to decode
anything reliably.

I'm not sure about the exact point where you lose the digital signal,
but it should be close to what I said. It still gives you the idea
behind the info.

FUNC SCROLL FUNC SCROLL.

Also, I was confusing the XT with another model. The ERR rate is
actually an ERR rate and lower is better. Reverse the numbers I posted.
a 9 out of 10 decode would show as a 10% ERR rate, and a 40% ERR rate
would go digital, and a 90 ERR rate would mean only 10% decoded
correctly and result in no audio.

Geez, Joe . I get better decode as the err rate approaches 0, and it becomes intolerable about 70 or so.

I think your description was just backwards. It is really error rate, not anti-error rate.

Dan Danz (WA5SKM)

From: Jeff Miller
Topic: 2671 Message: 2672

The first questions are:
1) what bands do you want to monitor? Asking because if you monitor one band IE 800 Mhz trunked systems or VHF Air you are better off getting a band specific antenna. If you monitor a bit of everything go for a wideband antenna.
2) are you rural or in a city?
3) Do you get interference with the included rubber duck antenna? If yes expect it to get worse with an outdoor antenna.

Sorry I have not used this antenna so I can't give a recommendation on it.

Personally I just ordered an 800Mhz Yagi from them in order to improve my reception of another county.

From: k5hdm
Topic: 2671 Message: 2673

I have the WBV-60 and the Sky Band Base antenna.. I had them both up at the same height and the S-meter is ALWAYS stronger on the sky band.. and the skyband antenna is 50 bucks cheaper... I thought the reception might be a fluke since the antennas were on different ends of the building, so i switched them and the Sky Band definitely works better. You miss out on 200mhz (1300-1500) but I'll bet it picks up those 200mhz as well as the WBV-60. Now I only have the Sky Band up.. I have tried A LOT of base antennas, and I really like the Sky Band... Here's the skyband:
http://www.scannermaster.com/Sky_Band_Base_Antenna_p/15-540715.htm .. The only antenna that compares with my sky band is the DD1300 found here:
http://www.scannermaster.com/DD1300_Double_Discone_Base_Antenna_p/25-541144.htm and it's 100 more than the sky band with maybe 1 s-meter bar improvement.. I did the same test with it, and ended up putting the DD1300 at our lake house.

Hope that was informative,
K5HDM

2674. Colorado DTRS

Date: 2009-09-08 14:39:51 UTC
From: martinezjohnnie
Topic: 2674 Message: 2674

Does anyone (UPMan?) know how the 80 or so sites in the Colorado DTRS were selected and programmed in the BCD396XT?

As fast as the XT is, it takes some time to scan 80 sites. I'd like to be able to lock out and leave on a shorter list of selected sites as I occasionally travel through Colorado. It would really help to know which sites in the XT's pre-programmed list correspond to actual sites in the statewide system.

Thanks.

You can use FreeSCAN to change the status of the sites, L/O, or re-tag the Quick Key. You could change it so the towers you want are activated with the startup number key, or even use GPS settings for location based scanning.

I'm pretty sure the info came from RadioReference.com

You can lock out sites you would never be in range of.

As I understand it, several sites use duplicate frequencies, so that
will slow down the scan speed.

If you're mobile, you could always use a GPS to only enable sites that
are close to you.

> Does anyone (UPMan?) know how the 80 or so sites in the Colorado DTRS were selected and programmed in the BCD396XT?
>
> As fast as the XT is, it takes some time to scan 80 sites. I'd like to be able to lock out and leave on a shorter list of selected sites as I occasionally travel through Colorado. It would really help to know which sites in the XT's pre-programmed list correspond to actual sites in the statewide system.

I'm pretty certain you're correct about RadioReference being the source.

I took a quick look at the RadioReference information for the system this morning, and, without actually counting them all, it looks like there's 'way more than 80 transmitter sites in the Colorado DTRS.

I'm just wondering which 80 sites were selected for the pre-programmed BCD396XT.

Thanks.

If you enter the programming menu [MENU button, PROGRAM SYSTEM, (select system), EDIT SITE], what does it show for the site names? That should correspond to what you see on RR somehow.

There is not a 1:1 correlation. I deleted duplicates and combined geographically disparate sites as needed to keep the system within the limits. That system is meant only as "something to listen to while you program the scanner for real." Any notes I made when making the system are long gone.

Thanks, Paul.

That was a lot of work, and it's been a useful option to have as I pop in and out of southern Colorado. I've especially appreciated the talk-group ID's.

2685. Old Newbie Help with my BC396XT

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-09 18:30:30 UTC
From: august_varady
Topic: 2685 Message: 2685

OK, I have had scanners in the past and they are so different then this new one, I feel like I went back down to newbie status.

Anyway, to my questions, I want to scan Michigan State Police, its already pre-programmed, but it doesn't ever pick anything up. I manually programmed a new system for the local digital trucked system and that is working fine, but am not getting MSP yet.

Also, it keeps showing Alaska on the main screen. I tried locking it out, but it still shows up. Do I have to delete all the systems I wont use? Will that help me listen to the Michigan State Police?

My manual programming shows up in the bottom bar and is called s0 (I think of it like a bank) and the Alaska one show up as s2. Is there a way to switch what s2 looks at or something. I am a little lost here.

Once I get the MSP working, I can focus on putting some conventional systems on it.

Alaska is the only system that is unlocked when the radio is first turned on. You have to hit the Menu Button -> Then select Program System - Choose alaska and lock it out. Then go back to program system again choose Michigan (whatever the name of it is) and unlock it.

Sorry I am not familiar with the exact key presses to do all this but the above is a general overview.

Actually, a much faster way is to use the SQK assigned to the system(s). The preloaded systems are assigned as documented here:
http://info.uniden.com/twiki/bin/view/UnidenMan4/UsingPreloadedSystems

(Alaska is SQK 21, Michigan MPSCS is SQK 33)

I've posted this before, but thought it might be helpful to your
understanding of the system and group quick keys.

System Quick Keys (SQKs) allow you activate and deactivate systems or
trunked sites for scanning. For conventional systems, the SQKs are
set at the system level. For trunked systems, the SQKs are set at
the site level. There can be more than one system or site assigned to a SQK.

The single digit SQKs are toggled between active and inactive by
pressing the corresponding key on the keyboard. The two digit SQKs
are toggled between active and inactive by pressing the ./NO key
followed by the two digits on the keyboard.

The display

S0:1234--7**0 indicates that SQKs 1, 2, 3, 4, 7, and 0 are active;
SQKs 8 and 9 are inactive; and SQKs 5 and 6 are unassigned.

S1:12---678** indicates that SQKs 11, 12, 16, 17, and 18 are active;
SQKs 19 and 10 are inactive; and SQKs13, 14, and 15 are unassigned.

Etc. to S9:12345678790

Each system can have up to 10 Group Quick Keys (GQKs). The indicator
for the GQKs is the line below the SQK line and works the same way
except that it only has ten possible values and therefore is only
single digits. There can also be more than one group assigned to a GQK.

GQKs can be toggled active and inactive by pressing FUNC and the
keyboard number while the scanner is scanning the particular system
which contains the groups that you are controlling.

If you use software to program your scanner, you can assign the SQKs
and GQKs as you set up your programming and can also set
the initial state of the SQKs and GQKs.

Hope this is helpful.

That's not true. All the Systems are unlocked. They are just *disabled*
via their respective System Quick Keys (SQKs). Just disable the Alaska
System with it's SQK, then enable the one(s) you want with their SQKs.

In order to get MSP going you need to delete all those pre-programmed sites and start over. Don't know why they did that. I did that here in St Louis only able to listen oto StarCom 21 in Illinois. Only problem is that there are 360 site towers with all there control channels and what you end up with is not much. So you should delete all pre-programmed sites and start from scratch. Not much fun, but when you get the scanner programmed to suit your needs, like the conventional systems, you should have smooth sailing

I can't think of any reason why it would be necessary to delete those systems unless you wanted to free up the space or the system quick keys. You can certainly program in other systems in addition to what was there to start with without deleting the initial setup. It's just a matter of knowing how to activate and deactivate the various systems using the system quick keys. Until you understand the system quick keys, you are likely to find the scanner confusing. Once you understand them, you are likely to wonder why you were previously confused.

It depends.

If you want to enable/disable all the sites at the same time, program
the SQKs the same.

If you want to be able to enable/disable the Sites individually, assign
different SQKs to each Site.

It's all what you want to do and how you want the scanner to work that
will dictate how the scanner should be programmed.

I carry my handheld scanner in my carry-on bag on flights in/out of Oregon, California and Alaska and it's never been questioned.?? I travel about every other month and?the scanner has been along for the ride for the past year or so.? I remove the antenna (so it doesn't look so much like a radio...probably not necessary but I haven't had a problem so I'm not changing) and it's wrapped in plastic grocery bags for cushioning.

I couldn't find anything on TSA's web site prohibits scanners.? I suspect that as long as you leave it off, you'll be fine.?? I'd also suggest that you pack your carry-on so that there is no reason for TSA scrutiny.

That's my experience.? Good luck!

Brad

That's not true on all flights. Some will let you use it except during take-off and landing. All electronics have to be turned off then.

I try to look for carriers that don't prohibit their use. They are out there.

Actually, the moderator (not me that time) missed a couple errors:

I understood his message, even with the spelling mistakes. Were <We're>
not graded here<,> this is not school, <and> we don't pass or fail on
the mistakes in our messages. At least his post contributed to the
thread, y <. Y> ours is nothing more then a personal attack on another
member.

But, I agree with Mel's concept of the reply - please don't criticize
other people's grammar. English is not everyone's first language on this
list, and not everyone got straight A's in school. In some cases, typos
happen, too. If you must comment on someone else's grammar, do so via
private email and not on the list.

As longs as yuns can understandz da post, know harm know fowl.

Well I have to agree that government employee's should know how to spell and show some pride in their education. The problem is EBONICS and a failure of our schools to teach spelling and English properly. Pretty sad when my ex girlfriend wants to join the Army but can't spell military! She actually spelled it "milty". It's also sad that she has no clue what the difference is between buy, bye, and by.....
So yeah I'm peeved to at the post by a TSA employee who can't spell.....

John

Give yourself at least one month , maybe two, to become more relaxed using it. I have been scanning for almost 35 years and it easily took me two months to become even the slightest bit comfortable.

Good advice. That applies to all the newest scanners. I think a lot of the new owners of these fine scanners just feel overwhelmed and give up. Play with them and try first. Don't be afraid of making mistakes. The scanner can alway be reset.

Speaking of Michigan, is there a Yahoo group (or other message board) that focuses on the Michgan MPSCS system? I didn't have very good luck receiving MPSCS while I was in the Detroit area for the Woodward Dream Cruise in August.
Thanks,
Bill E.

Something to keep in mind with International flights are the laws in any country you will be going to. Not all of them allow for legal scanner possession. Some of them also have laws on what services you can monitor.

If you have all the trunk system channels programmed in your scanner, it gives a visual representation of which channels are currently active.

Joey,

I think it's fair to think that most of us greatly appreciate information provided, particularly when it's from someone with the experience to provide valid and useful information. Please don't interpret the rudeness of one poster as in any way reflecting the views of the rest of us.

Dick

Hello,

It would display "Charge Complete" after the time setting.

It's possible if you're using cells that are nearing the end of their life. Any cell could short and release a great amount of heat. It really has nothing to do with any particular scanner model or manufacturer. The odds of this happening are much greater when charging then when discharging the cells which is likely why you heard it when "using the charger".

How likely is it? Not very, but the chance is not zero.

Dan:

I travel often and have taken both my 396's with me, a couple of ham radio HT's, a portable shortwave not to mention spare batteries, antennas, and all sorts of things.

Now, it might get their attention and they often like to pick through my bag, but when they finish they offer to repack it and I thank them but tell them I'd rather do it.

They also seem to like to look at collapsible antennas for some reason!

Good luck, but I don't think you'll have a problem other than a few extra minutes going through security. Also, occasionally, they have not even stopped me!

Honestly anything designed to charge NiMH cells. While the scanner can
do it, it was not designed to do that.

I like the MAHA brand chargers. Others like Lacrosse. I think those are
the two most popular brands.

No matter what you get, make sure what you get will charge the cells
individually, not in pairs.

2739. Charging batteries - in the radio or via external charger

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-17 09:20:29 UTC
From: shelleysh1@att.net
Topic: 2726 Message: 2739

This has been a topic, as most all of us know, which as been discussed in great detail since we started using the nickel metal hydride batteries in our handhelds. Personally, I have believed that damage done to a radio may (and I stress the "may") have inadvertently been caused by the user but there is ALWAYS a chance where a radio could have a problem and it has nothing to do with the user. Regardless, I NEVER charge batteries in my 396XTs (or any of my handhelds for that matter). No, I don't believe it will damage the radio if I do, my reason is purely for efficiency. It takes me less than an hour (usually half that), tops, to fully charge 6 batteries! Then I put them in a plastic holder in the glove box in my car and now have backup batteries whenever I need them. I never have batteries in the 396XT which is directly connected in the car (doesn't go through the cigarette lighter). If I take it out, to take it with me, I take the case of 6 charged batteries along. It's that simple. I actually keep more than 6 batteries charged - I have the second 396XT at home and keep another 6-12 batteries charged there. But my point is that I do not keep batteries in the radio until I disconnect it from a power supply and then run it on batteries and those batteries are already charged via a charger. One can certainly charge batteries through the radio but I'm just not patient enough to do so. I do NOT believe it will hurt my radios - I simply do not want to wait the time it takes to fully charge them in my handhelds.

Subject: [BCD396XT] Backlight at power on

My scanner is typically hooked up to AC power. Is there any way to force the backlight to come on at power-up without having to press the button?

2743. Scanners and Bluetooth Adapters ?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-18 04:16:39 UTC
From: Clark Rennie
Topic: 2740 Message: 2743

I presently use a Jabra A210 Bluetooth adapter with a Bluetooth head set for listening to my BCD396XT.
My Cell phone is A2DP compatible and I use two Bluetooth headsets, not simultaneous.
One of my Bluetooth head sets (Jabra BT530) is also A2DP compatible. The manual for the BT530 states that it is capable of switching from one Bluetooth device (scanner with Jabra A210) to the cell phone automatically if a cell
call is received. My setup doesn't do that.
Is it because the A210 is not a A2DP device ?
I would like to use the same Bluetooth headset for both the scanner and the cell phone and have it switch from the
scanner to the cell when reciving (or making) a call.

Any advice is welcome.

Clark

Good question but there isn't. Just a second quick push to the "Power On" button turns the light on.

Despite all the so called faults with the 396XT, it still is the best
scanner around.

I have been purchasing scanners from CEI since about 1981 or so when I got my BC-100 (the FIRST synthesized hand-held scanner, with a whopping 16 channels) with no problems. Lots of people have ordered from ScannerMaster with no problems, but my one experience with them didn't go well (they shipped to the wrong address on a 2nd day order, they admitted it was their fault, but refused to refund the extra money I paid for 2nd day). First impressions are lasting impressions with me.

2756. How is multi-site different between the T and XT?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-18 22:25:13 UTC
From: bbtkdus
Topic: 2756 Message: 2756

OK - while I understand what the multi-site feature is supposed to accomplish, is it really much different than putting multiple sites in a system as you can already do on a BCD396T - other than not having to waste memory for a copy of each talkgroup for each site? So - does it simply save memory but functions the same? Or - does it somehow handle multiple sites better? The reason I ask is that I am upgrading to the XT and here in South Dakota they use a statewide system with 55 sites (and growing). It would be handy to program several regions (east, west, central) with all of the sites and talkgroups from that region. Thanks!

Well, the T simply didn't have multi-site capability. The XT does. If
you wanted to properly scan several sites in the T, you had to program
each site as a separate System.

Each site should be programmed as a separate Site in the XT.

You can enable/disable each Site independently via SQKs in the XT.

Yes, it shares the same TG list saving a lot of memory.

The XT will evaluate each site in range for activity, and will quickly
skip sites that are not in range. This ensures you hear anything you
want to hear.

BTW, you can program all your east sites on one SQK, west on another,
and central on a third to be able to quickly disable each zone.

Scannermaster does a great job! I ordered two of them for a client a couple of days ago and they received them on Friday. Outstanding service! Rich has always done a great job and most often has some of the lowest prices out there for this radio. Last I looked it was $495.99 so check again on his site.

It isn't a fault. It's just how the radio works. Some may find it annoying, I don't - waiting another second or so doesn't matter. And I find few "faults" with this radio. What are all the faults you're talking about?

After all the advice (some to the contrary) I went with scannermaster over CEI. The best anyone said about CEI is that they were cheaper or that they hadn't had any problems. Since it was only $9 and since folks do tend to praise scannermaster, I went with scannermaster. Now that I think about it, I had a minor issue with CEI years ago.

I was very tempted to wait for the lady that occasionally lists them for $448 on Ebay, but that's always riskier and there is typically no follow up service that way - and I'm impatient. Prices sure all over the board on these! Amazing that some still sell the T at full price and higher than others get for the XT.

2764. EDACS Programming Question

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-19 16:49:47 UTC
From: SRehm24416@aol.com
Topic: 2764 Message: 2764

I am working on a EDACS system that I think is missing a frequency. I have the LCN order for the frequencies I already have. There are two spots that seem like?logical spots the one missing frequency might go. If I put the freqency in either of the two open spots, could it mess up the rest of the already properly placed frequencies in the system? Or will it act as if there isn't anything there? BTW, I am not using software.

Do you know what the missing frequency might be ?
No, no harm will be done to the system.
What I do when there is a hole in the LCN order, is to place one of the NOAA (162.xxx) channels in that LCN.
If I hear the weather, then I know its not a vacant LCN. Then attempt to find the missing freq.

The information here indicates that each frequency has to be entered
for the correct LCN, not merely in the right order. In other words,
there can be blank LCNs which must be left blank in order for things
to work properly.

http://gtrac.ztn.net/2001/eprog.htm

Hope this is helpful.

I bought my 396XT off of Ebay for $472 shipping included. No problems at all. Though now I would use scannermaster or grove enterprises to buy a new scanner.

Give me the state and county and one the the frequencies. I can look that up in the FCC General Menu Reports and get all the frequencies for that system for you--no problem.

I reasoned that since the DMA scanners do provide for entering a
frequency with a corresponding LCN, that they aren't merely concerned
with getting them in the right order. My reasoning could certainly
be wrong. I thought that the link at least shed some light on the
issue even if it didn't answer the question with certainty. So far,
I haven't been able to find a definite answer.

Here's some additional info. These systems are listed with numerous
empty LCNs and when imported using FreeScan preserves those empty LCNs.

http://www.radioreference.com/apps/db/?sid=341

http://www.radioreference.com/apps/db/?sid=3476

Again, not conclusive, but perhaps suggestive.

2774. Stopped decoding P25

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-20 03:31:03 UTC
From: Larry Koch
Topic: 2764 Message: 2774

Well, it happened again. One of my XT's just quit decoding my P25 system. All standard FM systems work fine but my P25 system is silent.

Line 3 of the display usually displays the control channel when there is no activity. When it stops decoding, the letters "NFM" are displayed instead. When I connect it to Freescan I get a communications error. I cannot read from it, write to it or control it.

To fix it I have to unplug it from external power, turn it off for about 3 minutes, then turn it on. That seems to fix everything. The control channel freq is now displayed on line 3 and I can communicate with it from my PC.

I have two of these XT's and they both have done it. It's kinda frustrating because I never know if there is no activity or the scanner has failed.

I contacted Uniden earlier and they suggested sending it in for repair. Since it is intermittent on both units I'm reluctant to send it in. If they can't duplicate the problem they can't fix it. I'm hoping they will discover a software problem that is causing it and include it in their next software release.

Has this happened to anyone else?

If you have all the trunk system channels programmed in your scanner, it gives a visual representation of which channels are currently active.

How far away are you from the P25 transmitters? You may lose the P25 signal on some P25 systems because of the distance between you and the Tower. Do you have a roof top antenna or what are you using for an antenna. Location and antenna make all the difference in the world.

Yes it has happened to others. I think it was discussed here also but there was no resolution to the problem.

Subject: [BCD396XT] Stopped decoding P25

ell, it happened again. One of my XT's just quit decoding my P25 system. All tandard FM systems work fine but my P25 system is silent.

Line 3 of the display usually displays the control channel when there is no ctivity. When it stops decoding, the letters "NFM" are displayed instead. hen I connect it to Freescan I get a communications error. I cannot read from t, write to it or control it.

To fix it I have to unplug it from external power, turn it off for about 3 inutes, then turn it on. That seems to fix everything. The control channel req is now displayed on line 3 and I can communicate with it from my PC.

I have two of these XT's and they both have done it. It's kinda frustrating ecause I never know if there is no activity or the scanner has failed.

I contacted Uniden earlier and they suggested sending it in for repair. Since t is intermittent on both units I'm reluctant to send it in. If they can't uplicate the problem they can't fix it. I'm hoping they will discover a oftware problem that is causing it and include it in their next software elease.

Has this happened to anyone else?

It has not happened to me. But I'm closer to the P25 systems,maybe than most. Mine will decode with no antenna on the 396XT, about .7 mile from main transmitter.

I suppose a poor signal could have something to do with triggering the problem, but basically this thing is a computer programmed to deal with an incoming data stream. Having worked with computers for 30+ years, the symptoms seem to point to a programming error that is overwriting something in memory that it shouldn't. Uniden will either need to reproduce it or evaluate a unit that has encountered it.

From: shelleysh1@att.net
Topic: 2764 Message: 2785

Dave, you have had your radio for only a short time and are sitting, as you've said, very close to City's transmitter. This is a problem others (such as me) who do not reside close to a trasmitter have experienced sporatically for a while now. I too have seen the same problem on one of my radios, but at first wrote it off to being my distance from City PD. Now I know it had nothing to do with distance because my 2nd XT would pickup the transmissions. The 396XT shouldn't "drop" a P25 system (or any other system for that matter) which has been programmed into it just because it may lose the signal. Just as Larry has done, if I disconnect the problematic 396XT for 5 minutes or more, it "corrects" itself and once again will decode City's P25 system.
There is also NO pattern as to when it will happen. It hasn't happened to me now for about a month. The time before that it was 2 weeks. This is a Uniden problem, not a user problem with distance. Although it *may* be that one could be so close to a transmitter it could force the radio to keep from faulting (but I really stress the "may"). Who knows? Only the techies at Uniden, if they sit down with this problem. Upman hopefully will get onto this, if he hasn't already.

Shelley

From: dmccorm@charter.net
Topic: 2764 Message: 2786

I could see it happening to one, but not both radios, unless it's a programming problem, or an interference issue. It's not happening to my P25 systems on multiple XT radios.

You mentioned that you used FreeSCAN to program. What you may want to do is make sure your systems are saved to FreeSCAN, re-initialize the radios and reload the memory. Then see if it still occurs.

Also did you program the systems by hand in FreeSCAN or did you use the Radioreference database?

Do you live near any other people with the XT scanners that are experiencing the problem? Can you can try there memory files? If you don't know anyone nearby, maybe post in the Radioreference forum for your state to see if anyone else has experienced the problem in your area.

If none of this helps, you'll need to send one to Uniden to see if it is an actual problem with the radio.

From: Uniden UPMan
Topic: 2764 Message: 2787

On Uniden DMA scanners, it does not matter what order you enter frequencies, as long as you apply the correct LCN to each frequency. You do not program unused LCNs.

Here's some additional info. These systems are listed with numerous
empty LCNs and when imported using FreeScan preserves those empty LCNs.

http://www.radioref erence.com/ apps/db/? sid=341

http://www.radioref erence.com/ apps/db/? sid=3476

Again, not conclusive, but perhaps suggestive.

Dick

I don't think signal has anything to do with it. As Larry stated when mine does it the computer will not commuinicate with the scanner.

Yes, I did this the first time I encountered the problem.

>
> Also did you program the systems by hand in FreeSCAN or did you use the Radioreference database?

I programmed the systems into Freescan by hand. I have made many changes over the past year in systems and groups as I tailored each scanner to fit my needs. One scanner is in my home along with my PRO-2096 and GRE-500. The other scanner is in my truck. Last month the one in my truck failed. Last week it was the one in my home.

>

No, I don't know of anyone else in this area that has an XT. Most everyone else around here is using RS models. They are more available and less expensive.

>
> If none of this helps, you'll need to send one to Uniden to see if it is an actual problem with the radio.

Yeah. I really hate to do this because it's hard telling how long I'd be without it. I'll probably just put up with it until they find the problem with someone else's.

I really appreciate your feedback. Thanks.

Engineering is closed most of this week for a holiday. I'll check to see what they say when they get back. Do not send any unit exhibiting this in for repair (well, unless you just want to be rid of it for a few weeks to no good effect). Since it is very intermittent and only occurs on P25 systems, it would be virtually impossible to duplicate here.

That said, you *could* program unused LCNs with the weather channels,
right? I like that trick to find new LCNs.

A very basic answer, and from what I have read, the standard is the major user in the states. If you live near a border (Canada I am assuming) the other? ... narrow ... would or could be used then. I know somewhere in this response there is an error but it is a basic beginning.

2797. Help me!

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-24 05:05:09 UTC
From: gabrielddc
Topic: 2797 Message: 2797

Hy folks!
I just bought my new BCD-396xt, and using the FREESCAN, made download of some agencies in Los Angeles and upload to Scanner, but when I use SCAN, the Scanner don't stop in any frequency, it still only Scanning.
I just can hear many things using the function: SEARCH/ PUBLIC SAFETY.

Anyone know what I am doing wrong?
Thank you so much.

2798. Mobile setup with BCD396XT and 2 Meter rig

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-24 05:06:48 UTC
From: Bob Arenella
Topic: 2798 Message: 2798

I have a Grand Caravan that I have a 2 Meter rig in
with a 1/4 wave mag mount antenna. I also run a VHF 1/4 wave mag mount
antenna for my 396XT. The antennas are about 4' apart. The 2 Meter rig
runs 50 watts out.

The obvious question here is for Upman or those with
ACTUAL experience running a similar setup. Up until now, I've just
disconnected the antenna on the XT when I transmit. I'm concerned that the
proximity of the two antennas is going to couple a lot of RF into the XT's
front end & possibly do damage. Both antennas are resonant in the VHF Hi
band, one cut for 146 Mhz, the other for 152.6 Mhz.

Anyone with some real world experience here?

Thanks,
Bob

You likely have your Systems locked out or disabled.

It would help if you UL your FreeScan file to the FILES section of the
group so some folks can look at it to see if there is anything obvious.

From: MCH
Topic: 2798 Message: 2800

If you can separate the antennas more, do it. You won't lose anything but you will gain isolation between the two antennas. You should be able to get them at least twice as far apart, and the induced power on the scanner antenna will be 1/4 as much if you double the separation. 4' is only about 2/3 of one wavelength which isn't all that much. In fact, your scanner antenna is likely affecting your 2M radiation pattern - acting as a parasitic element.

I would also make the scanner antenna length different so as to make it less resonant at 2M frequencies. Maybe trim an inch off it at least. If you're primary interest is the VHF Public Safety band, this will have the side effect of making the antenna more efficient at those frequencies as it reduces the power coming from your 2M antenna. It may not change much, but again, anything to reduce the signal strength of your transmitter into the scanner will help. All the little gains add up to a big difference.

If you were to put one antenna on the roof and the other on the fender, that would greatly help, too, as the two antennas would be in different planes and induced RF would be reduced even more. Vertical separation will always be more effective than horizontal separation when you're talking about vertically polarized antennas.

When antennas of equal resonance are only 4 feet apart, you might actually be able to measure watts of power coming down the second antenna lead. I've done this with gain antennas, and while your gain is 0 dB, it's still possible in your case. While your scanner may be able to deal with this to a point, it will cause problems not only with potential damage to the scanner's front end, but also with simple desense of the scanner while you are transmitting.

Again, anything you can do to reduce the signal strength picked up on the scanner antenna from your transmitting antenna will only help.

I've had three antennas (one two meter and two scanner) roof mounted on
Grand Caravans for years. Never a problem with RF damaging any scanner, and
they are connected to antennas all the time. Distance between antennas
about 18 inches. Can't speak for everyone but never an issue with me...

From: Walter Jinright
Topic: 2798 Message: 2802

Just from my experience, I space antenna according to guidelines I had found in an old manual for spacing repeater antennas. Which for me is 20 ft vertically, but on the vehicle, the scanner antenna is on the top center of my rear windscreen, and my dual-band antenna is 3 ft behind and down on the trunk deck. I never mount the same bandwidth antennas at the same height on my vehicle. Just a personal choice, I have found to work for me on a 1999 Crown Vic P71. So I am sure every vehicle design will dictate a different scenario for proximity RF.

2803. Stopped decoding P25.....again

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-24 20:42:05 UTC
From: Larry Koch
Topic: 2764 Message: 2803

Well, it happened again yesterday. Same scenario. Once I removed the power plug, turned the unit off for about 30 seconds, turned back on, everything was OK. IMPORTANT NOTE: I first turned it off for 30 seconds without removing the external power plug. That did NOT fix the problem. I have the charge time set to 1hour and I leave it plugged in all the time.

Do not send any unit exhibiting this in for repair (well, unless you just want to be rid of it for a few weeks to no good effect). Since it is very intermittent and only occurs on P25 systems, it would be virtually impossible to duplicate here.

Do not send any unit exhibiting this in for repair (well, unless you just want to be rid of it for a few weeks to no good effect). Since it is very intermittent and only occurs on P25 systems, it would be virtually impossible to duplicate here.

2807. Searching P25 NAC

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-25 00:15:14 UTC
From: CoolFlowerGal
Topic: 2807 Message: 2807

Ok so I need some help here. I'm in Pittsburgh for a few days and I actually have my scanner with me. I'm trying to find freqs for the G-20 thing going on here. I have all the Pit. PD stuff programmed. I found stuff for the mil freqs but it has a NAC code along with it. When I go into the scanner in the Srch/CloCall Opt, Tone/Code Search, then I select P25 NAC Search THEN it goes to the previous menu. I doesn't let me put an NAC code in there. Is any of this making sense? Here's the list I have:

150.5625 NAC 167 P25
150.6000 NAC 167 P25
153.2225 NAC 167 P25
157.6425 NAC 167 P25
168.8250 NAC 167 P25
163.9500 NAC 173 P25
165.9750 NAC 167 P25
168.5000 NAC 100 P25 Clear
169.0125 NAC 357 P25
169.4000 NAC 167 P25
169.8000 NAC 389 P25
171.3875 NAC 167 P25
150.5625 167 NAC
150.6000 167 NAC
157.6425 167 NAC
165.8250 167 NAC
165.9750 167 NAC
166.1250 167 NAC
169.4000 167 NAC
169.4250 167 NAC

Can anyone shine some light on what I'm trying to do?

-Dan

It goes to the previous menu because you have selected to have the scanner search for the NAC codes and there is nothing more to be entered. Since you're entering parameters for the Search or Close Call options, you won't enter a specific NAC. You're merely selecting whether you want the scanner to search for the CTCSS/DCS tone or for the NAC code.

When you program in one of the frequencies as a conventional channel, then you can enter the specific NAC if you've designated the channel as digital only. Similarly, if you have a CTCSS/DCS tone, you can enter it if you've designated the channel as analog only.

Looks like you got that off one of the Federal lists. Don't trust the
150 MHz frequencies. I think someone was picking up birdies. I've seen a
lot of channels linked with NAC 167, but never in the 150 MHz band. The
160 MHz frequencies look valid.

For a good list of G20 frequencies, try here:
<http://wa3fkg.blogspot.com/2009/09/g20-frequencies.html>

And for the NACs, you don't use them in the SEARCH/CLOSE CALL options.
You use them in the CHANNEL OPTIONS after you set the channel to DIGITAL
ONLY - exactly like CTCSS/CDCSS for ANALOG ONLY. You also have a SEARCH
option for the DIGITAL ONLY channels to search for the NAC.

I didn't mean birdies - I meant images. Long day.

Hi Shelley!

I guess I am on the opposite side of the spectrum on this subject.? I am a horrific abuser of rechargeable batteries.? I leave them in my 396T and 396XT all the time, with the units running on the batteries about 80% of the time the radios are on.? When I hear the low battery indicator start beeping, I will plug the radio in for however long I want to listen to it. That could be 10 minutes or 5 or 8 hours or anywhere in between. On the weekend, I might get around to leaving one or both plugged into the wall charger long enough to complete a charge cycle.? At some point, usually not less than two years or so, I will get a charge error message and I toss out the batteries and get some new ones.?

This has been my practice for all my rechargeable portable radios going back to my PRO-43.? I don't recommend this strategy to anyone, but I have never had any issues at all with charging batteries internally in Uniden or any other type scanner or HT.

Scott

Subject: [BCD396XT] Charging batteries - in the radio or via external charger

This has been a topic, as most all of us know, which as been discussed in great detail since we started using the nickel metal hydride batteries in our handhelds. Personally, I have believed that damage done to a radio may (and I stress the "may") have inadvertently been caused by the user but there is ALWAYS a chance where a radio could have a problem and it has nothing to do with the user. Regardless, I NEVER charge batteries in my 396XTs (or any of my handhelds for that matter). No, I don't believe it will damage the radio if I do, my reason is purely for efficiency. It takes me less than an hour (usually half that), tops, to fully charge 6 batteries! Then I put them in a plastic holder in the glove box in my car and now have backup batteries whenever I need them. I never have batteries in the 396XT which is directly connected in the car (doesn't go through the cigarette lighter). If I take it out, to take it with me, I take the case of 6 charged batteries along. It's that simple. I actually keep more than 6 batteries charged - I have the second 396XT at home and keep another 6-12 batteries charged there. But my point is that I do not keep batteries in the radio until I disconnect it from a power supply and then run it on batteries and those batteries are already charged via a charger. One can certainly charge batteries through the radio but I'm just not patient enough to do so. I do NOT believe it will hurt my radios - I simply do not want to wait the time it takes to fully charge them in my handhelds.

I got 3 (4-packs) of 2,900 MAh NiMH batteries off ebay and keep two sets charged and one set in mine all the time, this eliminates me even having to plug the unit in, unless I forget the spares at home and charge in the car. Plus the higher current batteries run much longer than standard 1500 MAh batteries found at most places.

Do the 2,00 NmHs last longer of a charge than a say 2,100 NmH?

Yes, I have noticed a number of hours extra from the 2,900 Mah batteries over 2,000 Mah, I have not used the 2,100 Mah - but I would think it would be close to that one, but that is about a 70% duty cycle, not on 24x7.

No matter the duty cycle, you should notice nearly a 50% (actually 45%)
increase using 2900 mAH cells over 2000 mAH cells. That is, if they
really are 2900 mAH cells.

You've activated system hold by pressing HOLD for more than 3 seconds.

Press HOLD for 3 seconds again to go back to normal scanning.

See the description of the HOLD button at:
http://info.uniden.com/twiki/bin/view/UnidenMan4/ScanMode#Keypad_controls

Thank you gentlemen for your prompt and correct answers. Very much appreciated. Boy do I feel dumb!

I really wish Uniden had put a manual in with this scanner. I hope it's not their new policy..... I would gladly pay for a manual like the one I got with my other 7 scanners. Seems kinda petty to me.

Again, Thanks.

Paul cited the link to the manual.

No, paper manuals are being left out of many items these days. Is it petty? Maybe. Most people use the PC term for it: Going Green.

Uniden is likely getting tax breaks for anything they do that will further the cause of those promoting the 'Green' agenda. Or, maybe they are just doing it to do their part in the agenda.

You can always do what others have done - take the file to your local Kinkos or equal and have them print you out a nice bound hard copy.

Personally, I read the online info and have one less manual laying in a drawer that will eventually get burned with the trash (I know - not very Green on my part). Of course, by me not having to burn a manual, I guess I too am part of the agenda. :-)

I'm not one to protest places that are not Going Green, but I'm certainly not going to protest doing it, either. The info is still available even though it's not on paper from the factory.

Being in Canada, you should appreciate the effort to save your vast pristine frontiers. :-)

Do not send any unit exhibiting this in for repair (well, unless you just want to be rid of it for a few weeks to no good effect). Since it is very intermittent and only occurs on P25 systems, it would be virtually impossible to duplicate here.

Hi Scott!

I used to use my radios exactly like you do right now. But as time's gone on, my habits and schedules have simply changed. One of the beauties of the rechargeable batteries, speaking of the nickel metal hydrides here, is that you don't have to worry about completely discharge them before recharging as you did with the NiCads (shortening the life)!

I actually do keep a charger in the car though - one that will work off the cigarette lighter - just in case the 396XT which I use mobile and carry with me if something is going on needs more charged batteries than I have ready. As mentioned, I keep 6 charged in the glove box, but I almost always have another 3-6 in my trunk or often in my purse.

I guess I'm just not as patient as you are! I want mine to be charged faster than I can get it done in my radio. LOL So I plug in a charger and get 'em done in less than an hour.

Shelley ;)

Here are the exact directions from Uniden:

Go to the website shown below from Uniden and register with our website
to gain access to the software download area.

http://www.uniden.com/my/

Once you log in you will see a link on the left hand side of the screen
that says "Download Area". Click on it.

You will now be in Unidens software file download area.

Click on the link in the scanner area for the USB-1 to take you to the
driver software available for that product.

2829. BCD396T/BCD396XT SMA connector

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-27 03:36:07 UTC
From: bbtkdus
Topic: 2829 Message: 2829

I recently got a Tuf Duck (Laird) EXS150SM duck for use on my BCD396XT and found that it apparently uses a different variant of the SMA than the 396 does. Tried it on my 396T and same story. When screwed on there is a 1/8" gap between the radio and duck. They also make an EXS150SMI for Icom and an EXS150SMV for Vertex (Standard/Yaesu). Apparently the 396 takes an SMA with a deeper socket. Anyone have any experience with different SMA connectors and perhaps know what the Uniden SMA is similar to - Icom or Vertex? Thanks!

I am very happy with the Antenex DEXE821sm covers 821 - 902MHz hidden sma male connector.

I can sell a few for $35 shipped if anyone wants.

Since this is also made by Laird and uses the same SM connector, does yours also leave a gap when mounted on the 396?

I have a BNC to SMA adaptor that I used on my previous BCD396T that I connected to various antennas that were BNC, and the following antennas, one that was stock on a Yaesu FT-60R (Tx or Rx) , a multi-band BNC (Rx only), a VHF (Tx or Rx) BNC "high" (believe was 140's to 160's in MHz, and a UHF (Tx or Rx) that was on a radio I used in the 440 band and 460 public safety band.
I will sell ALL, antennas and adaptor for $22 shipped to 48 US states, over-seas, contact for price quote.
I just got rid of both of my 396 models for the new 996, the side button kept causing problems with using on my belt connector. I do not travel away from the house enough anyway, so the base models suit me better.

These do not have to be used for the 396 alone, sure the adaptor is great for it, almost a MUST if you use a base antenna. But can be used on almost any BNC or SMA portable scanner or two-way.

SMA is SMA (aside from 'reversed SMA'). One of the two is not following the SMA specs. Since I've used several SMA antennas on the 396 and they all fit, I suspect it may be Laird that is the problem side. One of my favorite antennas is the dual band Tuf Duck which I don't think they make anymore (a shame since it works so well), but it is the BNC model.

Paul cited the link to the manual.

No, paper manuals are being left out of many items these days. Is it petty? Maybe. Most people use the PC term for it: Going Green.

Uniden is likely getting tax breaks for anything they do that will further the cause of those promoting the 'Green' agenda. Or, maybe they are just doing it to do their part in the agenda.

You can always do what others have done - take the file to your local Kinkos or equal and have them print you out a nice bound hard copy.

Personally, I read the online info and have one less manual laying in a drawer that will eventually get burned with the trash (I know - not very Green on my part). Of course, by me not having to burn a manual, I guess I too am part of the agenda. :-)

I'm not one to protest places that are not Going Green, but I'm certainly not going to protest doing it, either. The info is still available even though it's not on paper from the factory.

Being in Canada, you should appreciate the effort to save your vast pristine frontiers. :-)

I've noticed the same thing using a Diamond SRH77CA. It does not seat down all the way.

I had a 396 previously and didn't have this problem. I also was using the same king of antenna but this is a newer one I ordered for this radio so I'm not sure if it's an antenna or radio change.

I sold the old radio/antenna to my neighbor so I can find out.

I don't have a single SMA antenna (I have a dozen or so), other than the Uniden, that completely covers the threads. There's always a gap. Most of the time I simply fill the gap with a rubber O ring, rubber washer, or a rubber grommet cut in half to fill the gap. It's stable, helps keep the antenna tight, and looks nice. Much cheaper than buying antennas that may or may not achieve the result you want.

And your statements aren't twisting it? Pot = kettle = black.

The SW is completely unrelated. Paul will have to address that issue if
he wants to.

As for it being about money rather than trees, you could be right. All
these 'Green' issues could only be about the money. But, Uniden is not
the only company involved in 'Going Green'. Even the government is
involved, of course they get a lot of lobbyist money for passing laws
and perks for companies that are doing these things.

GRE is doing the same thing, BTW. Hey!!! Maybe it's a conspiracy!!! ;->

I guess it all comes down to whether or not you feel Global Warming is a
real issue. Of course it exists - the world is still coming out of an
ice age, and it will continue to get warmer. But, do you believe that
the climate is being affected more than the basic warming that is a
fact. That's the question few people (if any) can answer.

Any money saved by them will ultimately mean we pay less for their product.

As for manuals, no matter what product it is, if I can find the manual on-line I save a copy in my "manuals" folder. If I can't find a copy on-line, I scan it, save it in my "manuals" folder then send the paper copy to our local recycling center.

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-09-27 18:28:57 UTC
From: bbtkdus
Topic: 2829 Message: 2841

I've spent some time googling and seem to be piecing together that indeed someone is not following spec. The trick is to figure out whether the Tuf Duck/Laird SM, SMV, or SMI is 'standard'. I'm kicking myself that I just sold an Icom R5 that I could have tested this with. Anyone have an Icom R2 factory antenna they can test on their 396? Since I have had SMA antennas which did not snug on the Icom either, leaving the same gap as the SM does on the 396 - and since I've found a site that says that Icom is 'standard SMA' and had a vendor tell me that the 396 is standard, I must conclude that I want the SMI variant. I'll still wait to hear back from Laird before buying.

BTW - after two days with the 396XT I have to say that of the (literally) dozens of models of scanners I have owned/fixed, the XT is by far the best. The T was nice, but on the XT the audio is much clearer and the motorboating is gone. Also, the multi-site system feature is nice since all of South Dakota uses a 55+ site police/fire/CD/etc system.

As long as the antenna is not loose on the connector and the center conductor is making contact with the socket in the center of the female SMA connector, the antenna should work fine. If you're concerned about athletics you might consider trying to put a round rubber piece or a rubber washer in between the body of the radio and the antenna. I have noticed with PL-259 connectors that not all of the male connectors have the same depth threads therefore not all cables or antennas fit all the way down over the threads. However they work just fine as long as the connection is tight.

Good luck,

Chris, KD0EGE

I agree there, n harm, no foul, at least on my end not getting a paper manual. Besides, I can download and "study" the entire works of a unit even before purchase, so when "hands-on" starts, I know much more than if I pulled it from the box "cold".
And sure, with awareness in this age of going "Green", @ the age of almost 40, I have just begun doing "my part" in helping over the past few years.
O.k., off topic a little, but what does it hurt to separate your plastics, paper, glass, metals, and organics (which can mostly go to compost if you garden)? In my area there are many "drop-off" containers, and it costs NOTHING to dispose of 95% of my "waste" that way!

Sorry for going off topic, I just thought Larry was on a great subject there and hoped you didn't mind me adding that Gentlemen / Ladies (got to say that as I think I only "know" 1 person in the group, and do not want to offend any Ladies here :-)

This page contains a reference to a gentleman that sells SMA to BNC adapters. As you can see, he offers a number of different models and lists the radios that each one is known to fit. The list may be helpful in your effort to sort things out.

BTW, I'm very pleased with the two that I'm using on my 346XT and 396XT. I think that they are the BGA-76 version. Nothing wrong with the ones that came with the scanners, but I find the ones from KC2 preferable.

I am an engineer so it bothers me when things are not quite correct. I am mostly worried about stressing the connector and the base snugging against the case would reduce the stress on the connector. A washer would work I suppose, but still not correct.

I see this as positive and necessary because the Uniden online manual can be updated with each firmware update. That way I'm always looking at up to date information. And the firmware updates are free. I'll take those two positives over the "loss" of a paper manual.

My $.02

YMMV

Thanks
brad

Subject: Re: [BCD396XT] Re: Flashing Hold

Paul cited the link to the manual.

No, paper manuals are being left out of many items these days. Is it petty? Maybe. Most people use the PC term for it: Going Green.

Uniden is likely getting tax breaks for anything they do that will further the cause of those promoting the 'Green' agenda. Or, maybe they are just doing it to do their part in the agenda.

You can always do what others have done - take the file to your local Kinkos or equal and have them print you out a nice bound hard copy.

Personally, I read the online info and have one less manual laying in a drawer that will eventually get burned with the trash (I know - not very Green on my part). Of course, by me not having to burn a manual, I guess I too am part of the agenda. :-)

I'm not one to protest places that are not Going Green, but I'm certainly not going to protest doing it, either. The info is still available even though it's not on paper from the factory.

Being in Canada, you should appreciate the effort to save your vast pristine frontiers. :-)

I believe the connector that Vertex/Standard are not the same specification that the Uniden connector uses. Maybe your looking at aesthetics, but I personally use the RadioShack 800MHz antenna for most of my handheld monitoring. It's wide banded enough, beyond the 800MHz, that it works well with the T and XT handhelds, so here is what I did: http://forums.radioreference.com/antennas-coax-forum/147334-radioshack-800mhz-antenna-mod.html

I found a cross-section comparison of the SMV and SM antenna bases, and the SMV (Vertex) is inset into the antenna, probably too much for the 396. The SM is shown to be quite shallow, so I'll get the SMI which should be in-between.

Around here everything used to be UHF but is now all VHF including the statewide digital system so I'm switching to a 3.5" duck tuned for 150 to 162MHz, the EXS150SMI. I'll also pick up the 6" EXB150SMI sometime. I like the shorter antennas for day-to-day around town use.

Hello,

I am new here i have posted a couple times but nothing major. I just got the 396xt Scanner a few days ago.
I went from BC200XLT to 396xt. A Big Jump and Big Difference in usage.

I believe i have managed to program the scanner without asking questions. Just only reading the manual online and radiorefernce Freq's. Like i said i think i got it figured out but i had a couple questions.

On the BC200XLT you can put in Freqs and just hit scan and it scans. but with the 396 you have TGroups and Sites.

I programmed what i had in the BC200XLT as sites and same city i programmed in Trunked "Moto Type II / P25".

I hear more stuff as conventional then i do with Type II. I have entered the TGroups for the Type II

The City i programmed was Glendale, CA

I was wondering if anybody has programmed this city in there System or can maybe take a look @ how i setup my programming with FreeScan and see if its done correctly.

I hope i make sense.

Thank you

2851. Re: [BCD396XT] Socal Cities

From: Richard A. Victor
Topic: 2850 Message: 2851

The reason that the 396XT has sites and talkgroup IDs which your previous scanner didn't have is because it is capable of following conversations on trunked systems. Programming trunked systems is somewhat different than programming conventional systems.

With respect to conventional frequencies, there are SYSTEMS which contain one or more GROUPS. A GROUP contains one or more channels. For each channel you enter the frequency, alpha tag, and various other parameters that relate to that channel. There are no sites for conventional channels. You enter the conventional frequencies that you had in your 200XLT in the groups of a conventional system.

SYSTEM 1
.....GROUP 1
..........CHANNEL A
..........CHANNEL B
.....GROUP 2
..........CHANNEL C
..........CHANNEL D
SYSTEM 2
.....GROUP 1
..........CHANNEL E
..........CHANNEL F
SYSTEM 3
.....GROUP 1
..........CHANNEL G

With respect to trunked systems, there are SYSTEMS which contain one or more SITES and one or more GROUPS. In each SITE, you enter the frequencies for that SITE. For each GROUP you enter one or more TALKGROUP IDS. For each TALKGROUP ID you enter an alpha tag and various other parameters that relate to that talkgroup. You can get the frequencies for a particular trunked system from the RadioReference database and enter the appropriate frequencies for each site of a particular system. You then enter the talkgroup IDs that you want to listen to in the various groups of that system.

SYSTEM 4
.....SITE 1
..........FREQUENCY 1
..........FREQUENCY 2
..........FREQUENCY 3
.....SITE 2
..........FREQUENCY 4
..........FREQUENCY 5
..........FREQUENCY 6

.....GROUP 1
.....TALKGROUP ID 1
.....TALKGROUP ID 2
.....TALKGROUP ID 3
.....GROUP 2
.....TALKGROUP ID 4
.....TALKGROUP ID 5
SYSTEM 5, etc.

According to the RR database, it appears that most, if not all, of
the Glendale agencies are on the ICIS trunked system which is described here:

http://www.radioreference.com/apps/db/?sid=2856

You may want to consider getting a premium subscription to RR so that
you can use FreeScan to directly download that system into FreeScan
and then transfer it to your scanner. If you choose to enter the
data manually, there is a custom band plan which has to be entered
for each of the sites which, unfortunately, adds some complexity for
a first time user of a scanner such as the 396XT.

If I understood what you've done thus far, I think you're going to
have to make some changes to get things working properly. If you've
got some further questions, don't hesitate to let us know.

Dick

Thanx Richard,

The Diagram helps me a lot.
One thing i don't get is the Band Plans but its not something i wont be able to read about.

You enter the bandplans in FreeScan on the Site Setup screen. When
you choose "Mot UHF Band" as the Site Type, a place opens at the
bottom of the screen to enter the bandplan. For the ICIS system, you
enter 470.0125 in the first box under Lower Freq, enter 12.5 under
Step, and enter 380 under Offset. Leave all the other boxes in the
System Band Plan blank as they are. You then click on the button to
the right which reads "Auto Upper" and FreeScan calculates and
inserts the Upper Freq for you. It should be 474.75000.

You need to do this for each of the sites for that system that you
choose to program into your scanner. You'll find that most systems
don't require you to enter a bandplan, but for those that need it,
it's important to enter it.

The values that I gave you came from the ICIS page in the RR database
at the top of the page under Custom Frequency Table.

This is what I have for Glendale which seems to work.

Glendale requires two Band Plans.
Lower Upper Step Offset
1. 470.0125 471.5000 12.5 380
2. 482.000 485.2375 12.5 500
I have the Upper Freq. for Glendale as 471.500, not 474.7500.

Yes, RR shows that as an alternate bandplan for Glendale. If you
just use the single bandplan which is shown on RR as the
"non-alternate", the upper calculates to 474.7500 using the Uniden
Excel spreadsheet, or the calculator built-in to FreeScan.

Since I'm nowhere near Glendale, I went with the one that RR showed
as the "non-alternate". It also had the advantage of being the same
for all of the various sites instead of being different from site to
site as the alternates are. Seemed that it would be easier for him
(or anyone else for that matter) to use the same values for all sites.

If the data at RR is, in fact, incorrect, then you should advise them
so they can correct it.

Using 470.0125 as the lower freq., FreeSCAN calculates the Upper Freq. as
471.50000. As does ARCXT Pro.

Thank you for the input numbers,
When the band plan you enter 470.0125 alone and hit upper it gievs you a total of 474.7500 for upper
but when you also input the alternative number as
482.00000 Lower then you calculate the 470.0125 goes to 471.5000 upper.

One other thing i forgot to mention that

I heard more talking on the BC200XLT then i do with 396xt.
I mean some talks would be scrambled because they are digital, since 200xlt=is analog.
But in general, when i turn on my 200XLT and my 396XT and put them side by side.

the 200 grabs more data then 396 does. and when 200 is tuned to a freq the 396
will just keep scanning. and this is only for Glendale i turn the rest of the cities off so its faster scanner.

Hope that makes sense.

Thank you

Yes, if you calculate it for the alternate bandplan which has two rows, that's the result that you get. However, if you calulate it for the "non-alternate" single line bandplan that's shown on the RR site for this system, you get 474.7500 as shown in the attached Excel spreadsheet that was provided by Uniden to make such calculations and also in FreeScan (copy attached). I get the same result in ProScan as well. Frankly, I can't get ARC-XT to even calculate a one line bandplan, but perhaps that's something that I'm doing.

The values in the second row change the results in the first row. Since the "non-alternate" bandplan has only one row, if you enter something in the second row you will get incorrect values for the bandplan.

Right. You either enter the one line bandplan for each of the sites
or you can enter the alternative bandplan for each site. If you use
the alternative bandplan, then for Glendale and Pomona you need to
enter both lines one and two. An entry on the second line affects
the calculation of the upper frequency on the first
line. Unfortunately, as I understand these bandplan issues, an
incorrect entry can result in hearing some but not necessarily all
transmissions so it may seem like it's working when it's not working
as well as it should be.

It's possible that you are hearing the voice channels of the trunked
systems on the 200XLT even though that scanner won't follow the
conversations as they move from frequency to frequency or decode the
digital channels. On the 396XT, if it's not properly programmed for
those trunked systems, you may not hear anything on those systems.

On the ICIS system, I have entered all the trunk freqs. of all the sites (not just control channels) and all the
band plans (if two are shown on RR, then both) and it works for me. Maybe someone else will try other
programming. djfred600, try Glendale both ways (471.5000 and 474.7500) and see which is the best.
I prefer ARC-XT Pro for logging as it displays the TG and the Freq. , over FreeSCAN because FreeSCAN only shows
the TGs. I can see that all the Glendale trunk freqs are being used, with my way of programming the ICIS system.

Another possibility is that the 200 is hearing encrypted data and
letting you hear the noise (it doesn't know it's encrypted since it
cannot decode it), and the 396XT is skipping the encrypted channels.
It's smart enough to not sit there letting you hear encrypted garble -
at least on trunked systems.

I agree that trying both ways makes sense, but it isn't just a matter
of trying a different upper frequency. In one alternative you enter
a single row bandplan and in the other you enter a two row bandplan
for Glendale. I've never disputed that the two row bandplan will
work. You seem to be implying that the single row bandplan won't
work. I have no way of knowing since I'm not there. If, in fact,
the single row bandplan doesn't work, I suggest that you notify RR
that the database is incorrect.

Bottom line seems to be to enter either:

470.0125 474.7500 12.5 380

or

470.0125 471.5000 12.5 380
482.0000 485.2375 12.5 500

both of which are computationally correct.

From: booth91208
Topic: 2850 Message: 2863

I live in Glendale and listen extensively to the Glendale ICIS site. I can verify that entering only the one-line band plan will cause you to miss lots of the traffic. I confirmed that fact using a second scanner programmed with all of the Glendale site frequencies (as if they were conventional channels).

The viewable RadioReference web page for ICIS shows "Alternate Custom Frequency Tables". The word "Alternate" should be replaced with "Required". As shown in that table, Clark Rennie's message has the correct band plan that must be entered for the Glendale ICIS site.

I started a topic on the RadioReference "Database" forum complaining about this problem, and recommend that you read the excellent response. The topic title is "Problem with download using ARC-XT Pro". To summarize their response, the RadioReference database was not designed to hold different multiple band plans for different sites within one system. Therefore, automated downloads will have erroneous band plans for complicated systems like ICIS. Knowing this, they added the table "Alternate Custom Frequency Tables" as a text box (it doesn't come from the database), with the intent that the users would manually enter the band plans into their 396's. They also said that they plan to fix the problem, but it requires changing the design of their database.

I sympathize with users having difficulties. I've been scanning since I built my first tunable receiver in 1962, but the new paradigm changes everything. I was very frustrated for the first few days, and almost returned it in disgust. I finally isolated the problems to two: the band plan issue, and another problem where ARC-XT Pro was having errors sending the channel spacing to the scanner. Once I got the channel spacing set properly, and the band plan manually entered, everything works great and I am delighted.

BTW, I reported the channel spacing error to Butel, and three days later I was notified that there was a software update; imagine my delight when I found that the bug had been fixed.

Thanx you for the help.

I have included the 2nd band plan and its working better then before

I think i have setup my radio right with the help of this group.

I will soon post the files up so if people want to scan the cities i have
programmed can.
but i will do that once i fine tune everything,

Thanx again.

Thanks for the straightforward explanation of what's actually going
on with that system and for taking the time and effort to get the
ball rolling to get the info on RR corrected.

So what's the best way to set up the BCD396XT so i can use my bluetooth headset to monitor traffics and comms? It comes in handy here in the house when i want to just wear my head phones and walk from room to room w/o missing any traffic, and also comes in handy for 'stealth' listening when i'm out and about.

I have something like this
http://tiny.cc/pHmv6
i used to use this when my phones did not have bluetooth, it worked really well. the plug is a mini jack the 396xt uses regular 1/8 jack.

If you can find something like this for normal 1/8 headphone jack you should be golden.

Best way? I only know of one way:

1. Plug your Bluetooth adapter into the scanner.
2. Pair the adapter to your headset (if you haven't previously done that)
3. Enjoy the wireless connection.

You'll need a bluetooth "dongle" that plugs into your scanners headphone jack. Any of the ones made for MP3 players (like the iPod or Zune) would work.

Hello,

You will need a Bluetooth Adapter (Jabra A210 or similar). You may need an adapter to 1/8" from 1/16". Pair your BT headset to the BT Adapter. Plug in adapter to Scanner Headset Jack, set volume, and you are set.

Check Ebay for a Jabra A210 adapter, lots of them. Also needed is a 3/32 to 1/8 adapter.
Radio shack Cat. 274-397 (Model 274-0397) about 3 bucks. Also of course a Bluetooth earpiece.

You'll need one of the Bluetooth adapters to plug into your scanner. Just make sure that the adapter and your proposed listening device speak the same protocol. The adapters for stereo headphones probably will not work with a mono cellphone earpiece and vice versa.

Forgot to mention that the battery saving feature on some cellphone earpieces will result in a short startup delay after a period of inactivity. You may or may not find that to be a problem.

That is very very true.

The Call will come in (Scanner) then from 1-2 second it will take to activate the earpiece.

If you need some additional range on your Bluetooth headset, here's a thread describing a way to get it that works very well.

The only real tough part is finding enough space inside the intercom to install that audio jack and switch. I had a tough time just finding room for the jack. The switch was out of the question so I used a normally closed switched jack. I think there may have been some change in the design of the case between the one he did and the one I did or else he's a magician.

Is this mono or stereo?

I ask because I have a Jabra A120 that is stereo (and has the correct connector for the 396) and it won't pair to my headset which does not support stereo BT.

There is a "BT-A" Bluetooth standard intended for quality audio applications. Has longer range and is stereo. It is used for BT wireless speakers and iPod headphones and IIRC is not compatible with BT for cell phones (certainly not the stereo part, anyway).

I'm using a Motorola MOTOROKR S9 Bluetooth Stereo Headset

That thing will not fall off! comfortable too unless you want to lean back in your Lazyboy....

Brad

Assuming the Sony TMR-BT10 Bluetooth® Adaptor Portable Transmitter is
BT-A, what headsets would be compatible with it?

(looking for more than just 'stereo headsets') ;->

2888. Determining and tracking a trunked system

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-03 17:08:33 UTC
From: Alex
Topic: 2888 Message: 2888

Here's a question for all of you.

When scanning, I'll occasionally run across a channel that lights up the "LNK" indicator telling me that I've stumbled across a control channel for some system. The question is, how can I instruct the XT to actually follow it when I know nothing about the system behind it?

2889. Re: Determining and tracking a trunked system

Yahoo group: BCD396XT (2008 — 2010)

From: Jason W
Topic: 2888 Message: 2889

The LNK is the preamble to a P25 voice transmission

if you hit on a 9600 Baud P25 system i believe it will show "DAT"
all other trunk systems will not show anything - someone correct me if i am wrong please.

if it is a motorola system you can program the control channel in and instruct the scanner to do a talkgroup search.

According to The Complete Reference, it indicates that data is being
received on a voice channel.

Ok, but is there a fast way to just tell the XT "follow this data and see where it goes" or do I have to create a temporary system, program in that frequency and guess at the system type?

I'm afraid that I can't answer that for you. Frankly, I haven't run into a system that wasn't listed in the RR database so I've just programmed in the systems that I want to listen to using the available data rather than having to search for them. If you find a control channel you can look up who holds the license for that frequency in your area and generally find the system info once you've identified the system.

Same Difference, LNK always appears just before a voice transmission starts which is the header of the digital transmission.

You can set up a custom search for the band you want to listen to
then set it to decode control channel data, when it stops on a P25 Data Channel it will follow the traffic but you wont be able to Alpha tag it or hold on a talkgroup

I got mine from ebay for $450 in mint condition.

And so far i love the scanner.
Its an advanced scanner, takes time getting used to but so far i like it no complaints about it.

Got mine from Scanner Master. They shipped reasonable fast. I believe the price was $385 plus shipping. And the 396XLT is the best scanner I have ever had and I have owned quite a few over the last 20 years. Has an unbelievable sensitivity. In my area (St. Louis) I receiver their APCO 25 system WITHOUT an antenna. I was amazed. You can't go wrong with this one. (KD0IEP).

scanner master is about $495 + shipping. (I wish it was $385)
eBay is often $490 - $514 + shipping for new.

Scanner master has Uniden warrenty.., eBay is unknown. Depends on the seller I guess.

From: computerwiz3531
Topic: 2899 Message: 2899

Hello everybody just wanted to share about pro scan it is a software to help assist scanners.I have downloaded it to my computer and have found it much easier to use then just the scanner alone.I thank everyone should at least try it. There is a 30 day trial at proscan.org.My name is william Heiser and it has really helped me because I am mostly blind annd seeing that little screen on the scanner was impossible. but beening on the computer screen it is much bigger display. I am still learning more and more thangs about the software it does so much to improve scanning.

Thank you for reading this everyone
William Heiser

I have a LTR system that I wish to monitor and it is shown on RR as a verified LCN order. However it starts with with a 0 (or 00) not a 1. Does anyone know if this might be a mistake or is there a way to enter this starting with 0? The scanner does not allow it as I am trying to enter it.

There is another frequency in the 1 spot so it wasn't entered twice.

I think that frequency with the 00 doesn't have an LNC. It probably is on the license with the other frequencies, and it isn't being used at this time.

Many of these LTR systems have a license for more frequencies than they need.

Both Grove (fave place for scanners) as Greg mentioned below and ScannerMaster (great place for accessories) are good sites to purchase from. I happened to get a great deal on E-Bay for my 396XT (472.00 shipping included) which is the only reason I purchased it from there. Universal Radio is also a good site though there was no Overnight or 2nd day shipping available when I've used them about a month ago.

From the O/M: http://info.uniden.com/twiki/bin/view/UniDenMan4/ScanMode
Searching trunked systems
* The scanner searches a system if the ID Scan Search option is set to ID Search .
* When any Talk Group ID becomes active, the scanner checks to see if that ID is locked out or in a channel group that is disabled or locked out.
* If the ID is unlocked or is programmed into a group that is unlocked and enabled, or if the ID is not stored in the system at all, the scanner switches to the voice channel and monitors the transmission until it ends or until the Delay Time expires.
* The scanner monitors the system until the hold time expires, then moves on to the next system.

Maybe the Channel Group you've stored the TGID in is disabled or locked out.

Thanks for the info. Is there a trick, outside of software, that can "find" frequencies for a LTR system if you have the right LCN order for the other frequencies? I am thinking along the lines of a regular TRS with control channel only programming, and the voice channel (freq) shows up on the screen when reception is detected. I think I already know the answer. They are apples and oranges and they don't work the same way. Thought I would try anyway.?? :)

Thanks for the info. Is there a trick, outside of software, that can "find" frequencies for a LTR system if you have the right LCN order for the other frequencies? I am thinking along the lines of a regular TRS with control channel only programming, and the voice channel (freq) shows up on the screen when reception is detected. I think I already know the answer. They are apples and oranges and they don't work the same way. Thought I would try anyway.?? :)

I've changed the notation in the dB to indicate that LCN 00 is unverified). LCNs for all frequencies except 860.1375 are verified. 860.1375 is licensed to the system, but no LCN has been submitted to the dB for it. If you determine that the frequency is being used on the system and can ID the LCN, be sure to submit the info to the dB.

Subject: [BCD396XT] LCN Order

?

I have a LTR system that I wish to monitor and it is shown on RR as a verified LCN order. However it starts with with a 0 (or 00) not a 1. Does anyone know if this might be a mistake or is there a way to enter this starting with 0? The scanner does not allow it as I am trying to enter it.

There is another frequency in the 1 spot so it wasn't entered twice.

I should also say that the method he describes can be improved in multisite scanners...rather than create multiple systems, create one system with multiple sites...each site dedicated to identifying a particular LCN.

If the group's GQK is disabled (or the group is locked out), the scanner will treat the channel as locked out.

I think I've got it fixed. Created a new system and new site, entered the
Trunk info. and freqs., copied all the Groups and TGs and now it seems to
be operating as it should in ID Search mode with the Groups not enabled by GQK.
Nothing seemed to be locked out, but something was wrong. Now all activity
is displayed.
The Groups were not locked out, just not enabled. Used ARC-XT Pro.

No, the Group is not locked-out nor is it enabled. But something funny is
happening.
Althought the display is scrolling "ID Search" it seems to be in "ID Scan"
mode because the TGs are displayed and the scanner stops on the TGs when
that QG is enabled but not when the QGK is disabled.
Maybe it needs a Reset ?

It does.

In ID SEARCH, the scanner will receive any TG that is not:

1. Locked out when it was received previously (scratchpad lockout).

2. Programmed in a channel that is locked out.

3. In a Group that is locked out.

4. In a Group whose GQK is disabled.

5. Encrypted (For P25 systems, scan resumes - for others, the audio is
muted).

Everything else will be received.

So the work around for having already programmed TGs into a Group, viewed
and scanned in ID Search mode
is to delete the GQK (not just disable it) . I did that, seems to be the
only way to see the programmed TGs.
With software it's easy to reassign a GQK.

Thanks, for the assist.

Clark

I got mine from Scanner World a few weeks ago, I paid $489.99 +S&H. You might try waiting until the after Christmas sales, if you can wait that long. Otherwise, I think that around $490.00 is about the best deal around for a new 396xt right now. I've seen it at that price a few different places recently.

Good luck,
Chris KD0EGE

The 'workaround' (AKA normal operation) is to simply
enable the GQK if you want to hear the channels it contains.

2924. Re: [BCD396XT] Re: ID Search

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-08 13:00:50 UTC
From: Paul Opitz
Topic: 2907 Message: 2924

Again, this is by design and as in the O/M. If the GQK is disabled, any channel in any group assigned to that GQK will be skipped during ID Search.

From: Clark Rennie <c.rennie1@...t>
To: BCD396XT@yahoogroups.com
Sent: Wednesday, October 7, 2009 10:03:39 PM
Subject: Re: [BCD396XT] Re: ID Search

So the work around for having already programmed TGs into a Group, viewed
and scanned in ID Search mode
is to delete the GQK (not just disable it) . I did that, seems to be the
only way to see the programmed TGs.
With software it's easy to reassign a GQK.

Thanks, for the assist.

Clark

And a good design it is. I just want to not skip any TGs in ID Search mode, (programmed or not) and deleting
a GQK is my choice for accomplishing this. I also know that enabling a GQK will do the same for TGs in that
Group.

Thanks again, Clark

2928. P25 One-Frequency Trunk

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-09 04:10:26 UTC
From: RobertKlamp@aol.com
Topic: 2928 Message: 2928

I have a question for Upman or any body else who has used this mode or has experience with it from the features list it says
:Support for P25 Conventional channels that include NAC and TGID user differentiation
I also looked in the manual and all I can find is instructions on how to program one and I think I am clear on the process of actually programming it but do not know how to tell what P25 frequencies this feature would apply to in other words how can you tell if the frequency you are monitoring would merit being programmed as a P25 One-Frequency Trunking system is there a control channel noise or does it come up like a P25 cc where it will display DAT on the control.
Any help understanding these systems would be greatly appreciated.

Thank You,
Bob Klamp

Topic: 2928 Message: 2929

From what I've seen (heard), there is no continuous control channel. It appears to be a conventional P25 channel, but sometimes those are single-channel trunk systems. There really is no way to tell if it is other than to try programming it as a single-channel trunk system. If you received TGs, it is. If you don't, it is not. I've seen both types.

This said, all my sources tell me that every P25 transmission has TG and NAC data transmitted with them - conventional or trunked. I'm not sure why some P25 channels will not trunk, but some definitely will not. (yes, I was in ID SEARCH mode and nothing was locked out)

2930. ProScan 3.0.0 Is Here

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-10 04:29:36 UTC
From: bob_proscan
Topic: 2930 Message: 2930

I just released the latest ProScan version.

Added ☐ Web Server and ScanCast. Works with all types of scanners and audio sources
Added ☐ RSSI value continuously updates in history grid
Added ☐ Mute button for muting the scanner audio
Added ☐ Remembers screen position of each view type
Added ☐ "Lookup Record Flag From Database" option to the recorder on the portable scanner types
Added ☐ Option "Write Current Channel Information To File"
Added ☐ Latitude & longitude conversion tool converts DMS (Degree-Minute-Second) to/from DEG or DD (Decimal Degree)
Added ☐ RadioReference splinter flag for automatically selecting the system or site as splinter
Added ☐ RadioReference rebanded flag for automatically selecting the system or site as custom
Added ☐ DMA scanners - Motorola Custom sites upper frequencies calculate button
Added ☐ DMA scanners - Download selectable systems
Added ☐ DMA scanners - Uploading systems checks if the scanner resources have been exceeded
Added ☐ DMA scanners - Faster opening & closing (saving) database files
Added ☐ DMA scanners - Automatically formats the TGID's to decimal or AFS on EDACS systems
Added ☐ DMA scanners - TreeView - Displays the number of frequencies / talk group ID's
Added ☐ XT Series scanners - Automatically formats the TGID's to decimal or hex on Moto systems
Added ☐ XT Series scanners - Checking the Private / Protect checkbox popup a warning message
Added ☐ XT Series scanners - Control Channel Band Plan to the Custom Search grid
Changed ☐ DMA scanners - Improved Upload & Download reliability
Changed ☐ DMA scanners - Improved Upload & Download interface
Changed ☐ Remote Scanner Over IP ☐ Put back in the audio from 2.0
Fixed ☐ Switching display views can cause flicker or lockups
Fixed ☐ RadioReference imported frequencies formatted incorrectly
Fixed ☐ RadioReference did not import the location data (latitude & longitude)
Fixed ☐ Band Scope "Tune Scanner To Marker Frequency" wasn't working
Fixed ☐ Remote Scanner Over IP - Recordings distortion at beginning
Fixed ☐ DMA scanners RadioReference importing the LTR TGID incorrect
Fixed ☐ DMA scanners - Frequency logging grid didn't retrieve text tags from database
Fixed ☐ XT Series scanners - Alert Light settings didn't upload or download correctly
Fixed ☐ XT Series scanners - AGC (digital and analog) settings didn't upload or download correctly

BCD996Xt and BCT15X Support will be coming December.

Bob per your request

One of three
I would like to ask you to consider adding the capability to allow one to set the screen colors of the XT class devices so that one can coordinated with the colors

the user has set within the XT. So if I set a Talk Group ID to display with a red screen within the radio, I would like to be able to tell ProScan to display that talk group with a red background. This will help provide visual alerts to me on the screen like Uniden intended when using the radio display.

Thanks.......and Keep Safe!

I would like to know what is the possibility of allowing the user of ProScan to have a choice of Radio Skins/UI. What I would like is to be able to use and similar looking radio skin/UI as the one used for the 396 but on the 796/296/250 radios. This will allow me to have a more consistent (curved) UI look and feel for all the radios I would be using ProScan to control and program. The various controls and buttons would all be in the same location minus the ones that the older radios do not have or can not be controlled via software.

2938. Feature idea

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-11 13:45:57 UTC
From: davef3138
Topic: 2938 Message: 2938

I had an idea for a possible feature pop into my head, let me know if I'm way off base or if this concept would be practical:

What if there was a way to create an 800mhz system (or other bands with the base/offset info) with a normal list of TGIDs but instead of defining the actual sites, you could define a range (or ranges) of frequencies, in which the unit would simple search out and maintain a control channel link for specific system ID.

Some settings could go along with this, such as locating a new control channel if the average signal strength drops below a particular threshold over a given period of time.

This would make it a snap to program wide area or statewide sites, especially if you're traveling through an entire state like Illinois or Minnesota.

Is this realistic? I'm assuming this is somewhat how the actual radios typically operate.

Dave in Minnesota

This one I don't think I will do.
1) I believe a 780 should look like a 780 and not a 996.
2) It will take a few months to do and I have already a few years worth of suggestions I want to get in.
3) Benift Cost ratio is too low.

It's a good idea, is 'doable', and would be a nice improvement.

It could go hand in hand with the SID System setting I've been wanting
for years (which would only evaluate a control channel if it matches the
SID you have programmed - distant systems that use the same frequency
would not be received - even if you are in 'their' area.

You could call it "System Search" to go along with ID Search and FTO Search.

But, is it something that enough people would want and use?

I know even Paul Opitz has had ideas that never made it to the scanner
firmware. I don't know exactly what they were/are (He only explained
that not every idea could be added - including his), but I could only
imagine how great a scanner would be if he got from the bean counters
and engineers everything he wanted. :-)

Greets,

I was looking for a easier way to connect the 396XT gps cables and I found one

Most users were using Seperate Null Modem adapters and Gender Changers,

after a little search i found these

http://www.pchcables.com/db9mmnumomig.html

an all in one solution and only $1.75 a piece

thought this might be of interest.

2949. On Screen Display

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-15 00:27:12 UTC
From: SRehm24416@aol.com
Topic: 2949 Message: 2949

I was wondering if you could change the way something is displayed on the screen while in the scan or search mode for a system?

While scanning, the top main line shows the 'site and group' or it shows the 'system and group' depending on if it is a trunked system or a conventional system. It flashes back and forth between names if they have different names.

I like the ability to name and sub-name (if you will) those sites/groups. However, it sometimes becomes annoying watching the line flash back and forth. Maybe just me but it does. While programming it makes perfect sense to have that all seperated. That is cool and I agree. It is just when it is in the scan mode that it bothers me sometimes.

Other than naming the site/group and or the system/group the same, can it be programmed so that there isn't any flashing back and forth of the names?

It's only while scanning that I don't want to see all the posibilities.

Thank you.

2955. ARC-XT SOFTWARE ISSUE

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-18 07:21:42 UTC
From: RobertKlamp@aol.com
Topic: 2955 Message: 2955

I have tried this on both the 396 and 996 XT and cannot get ARC-XT to upload a P-25 Single Frequency TRS, I tried multiple time and got the same outcome it will program the system info and NAC code but it completely leaves out the sites so I had to use free scan to upload the three P-25 Single Frequency TRS's
I had created. It will download from the radio fine but if you try to upload it back you lose all the site information but strangely the system is made without the sites I programmed into it on ARC-XT has anyone else encountered this or knows if But el Software is aware it is a problem, just wondering.

Thank You,
Bob Klamp

You want an adapter that has a 2.5mm stereo female on one side and a
3.5mm stereo male on the other.

Put another way, the A210 has a 2.5mm stereo male on it, and the scanner
has a 3.5mm stereo female on it, and you need the adapter that will
allow them to plug together.

Well, I went to the local radioshack and got a salesman that actually gave me an answer instead of a blank stare! The correct part number is {274-397} 3/32" Stereo Jack to 1/8" Stereo Plug Adapter. It fits and it was only 3 bucks.

http://www.radioshack.com/product/index.jsp?productId=2062474

Thanks for the replies

Dave could have been correct, too. There are different ones - gold
plated, standard, titanium (just kidding on that one), Etc.

3/32 is another way of saying 2.5mm,
and 1/8 is another way to say 3.5mm.

From: Alex
Topic: 2956 Message: 2965

The four conductor (Tip-Ring 1-Ring 2-Sleeve) connector would work electrically but the particular item quoted is of the wrong genders (male 2.5mm or 3/32" and female 3.5mm or 1/8"). The second part (single piece construction without the pigtail) is of the correct genders to make the conversion.

The standard stereo audio headset connector is the TRS (Tip-Ring-Sleeve) in various diameters but the second ring contact will simply short out in a regular TRS jack. Cell phones typically use the second ring for the microphone input. If it shorts out, the cell phone will just use its internal microphone.

The saga continues. The plug fits, but its not working. The blue lights are blinking on the Jabra 210 and the Bluetooth earpiece like its supposed to but I hear nothing. It must have something to do with the adapter I just bought because I have a set of logitech wireless headphone set up with the standard plug without using the Jabra and it works fine on those. Any other suggestions? thanks again

Kevin

Hey

I have a question regarding Close Call Mode (DND/PRI)

When i do a CC Search, it finds Freq's, then when i want to go back to Scan Mode again the Close Call Freq are still in the Scan list. How do i get rid of them from the radio, so im back to normal scanning with the CC Freq's showing up again.

I hope this makes sense.

You can turn off CC Hits with Scan and they won't be conventionally scanned after you leave the hit.

Either lock them out or cycle the power on the scanner. They are only
scanned in a temporary system that is cleared on power-up.

Hey,

I have a question regarding a freq i listen to

Disp1-CV-Alta - 483.98750

I can hear the Dispatch fine but the other end all i hear is
beeps, and the beeps can go as long as the person talks for.

Its a conventional freq so everything is set to Auto from Mod to Audio Type. I'm just wondering if there is anything I'm doing wrong.

Thank you

Sounds like they are using a repeater that is set to mask the signals on the input.

To hear them, enter 486.9875 in your scanner, but the cars will have to be much more close to hear them, and the scanner will lock up on the repeater since it transmits continuously. Maybe put 486.9875 in an adjacent channel, press HOLD when they are talking and switch between the two channels.

You could also put both channels in 1 system and put a long HOLD TIME on it and a negative delay on the repeater. That will cause the scanner to 'sample' the input at the given time period. Make sure you don't use a negative delay on the input frequency.

That also sounds like what the Maritime Telephones sound like, I know they are 2 freq. duplex but not on a repeater, but when the ship talks to shore while on a phone call, you hear the beep.....beep.....beep....etc. I also still hear some local Radio Telephones that do that on UHF, remember the HT's with the DTMF pads before cell phones were popular? Those are actually still used here, I have also heard that on a few Ham repeater phone patches.

The CHP used to send beeps over the base freq to let mobiles know the mobile channel was busy in the absence of repeaters on the low band system. I wonder if this isn't a similar thing, letting the mobiles know the repeater is busy without sending the mobile traffic.

If you are close enough to the mobiles you should hear them on the mobile freq of 486.9875.

Here in Iowa, Des Moines Police will put a beeper on a channel if they are closing it due to a chase or some other incident that requires a clear channel. Their channels are of course repeaters.

The CHP used to send beeps over the base freq to let mobiles know the
mobile channel was busy in the absence of repeaters on the low band
system. I wonder if this isn't a similar thing, letting the mobiles
know the repeater is busy without sending the mobile traffic.

If you are close enough to the mobiles you should hear them on the
mobile freq of 486.9875.

That is the Los Angeles County Sheriff's Dept channel for Altadena and Cresenta Valley. All of the LASD dispatch channels do that. They are repeater pairs, but do not normally run repeat. In order to let the other officers know that the input frequency is in use and that they need to stand by, the repeater output transmits beep, beep, beep (called a busy tone). when they have something hot like a pursuit, they "turn on the patch" and it becomes a real repeater. As soon as the hot event is over, they will drop the patch. Personally I find it obnoxious, and I don't know how the deputies can stand it. Fortunately I don't listen to LASD very often. The Local Tactical (called L-Tacs), Area Tactical (called A-Tacs), and Countywide Tactical (called C-Tacs) are normal repeater channels.

2978. Avoiding Systems with all groups locked out

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-25 09:17:59 UTC
From: Jim Walls
Topic: 2978 Message: 2978

Many of you will get this several times as I'm cross posting it to three groups. However it is relevant to all three.

One of the few problems with the Uniden DMA scanners is the ability to turn off all the groups within a system, and then it's kind of a pain in the neck to get anything in that system turned back on. Honestly I am very careful to avoid making that mistake so the result is that I can never remember what the process to hold your mouth just right, bow in the correct direction of the moon, and press buttons while turning knobs all at the same time to turn a group back on. Just to make it worse, the procedure is different between the mobile vs handheld scanners. There had to be a way to prevent turning off all the groups in a system.

I have found it! I NEVER use system or group lockouts - EVER. If I am going to turn a system or group on or off, I use quick keys. What I did was in each system, I created, I added a group that does not have a group quick key, and that group has one channel or talkgroup (as appropriate for the system type). That channel is programmed so that it is HIGHLY unlikely that there will ever be anything received that will open the squelch. For example, for conventional systems, I use a frequency in a high UHF TV (unused) with an oddball DPL. I call that channel and the group that it's in "keep alive". That way if I turn off all the groups, the keep alive group will still be on with it's one channel that never receives anything. Then it's real easy to turn desired groups back on.

One other tip. I have a system with a quick key of 99, that also only has one group and channel. The system is called: Rev. 2009-10-24 and the date is changed whenever I update the codeplug. That way I can look at any of the DMA scanners that I program (my 996T and 396XT, my work issued 396T, and several dozen other 396Ts that I program at work), and easily see what the codeplug version that is programmed into that particular scanner. System 99 is set to have a 5 second hold time and when a scanner is programmed, it is turned ON so that as soon as it is finished programming, I can easily tell that the codeplug was actually written to the scanner. Then a simple .99 and it's turned off. If I need to verify the programming of a scanner, a simple .99 and the revision date "system" is turned on for me to easily see. I do the same thing on the 796Ts at work except there is just channel 1000 and that channel is normally locked out.

The procedure for re-enabling Groups when all are disabled is not as hard as you make it out to be, and it's the same for all three scanners.

Press the FUNC knob (granted, it's in different locations for the portable vs mobile, but it's the same function), scroll to the System in question, and press the digit for the GQK you want to re-enable.

Yes, leaving a Group that is never locked out will work, too.

That is a good tip about the revision date! I would not assign any SQK to it, though. You can also put it in the boot-up display.

That is a good tip. For those who don't follow the tip, restoring scanning is actually pretty simple and is consistent across all DMA models:

FUNC + Scroll to the system
While FUNC is still activated, press the digit corresponding to a GQK to enable for that system.

Got a question about the 2900 mAh batteries. Is it my imagination or do they require a longer time to recharge. Also how long can you wait until after you hear and see low battery alert before turning it off and putting it in the charger. I guess what I'm saying if you run the batteries all the way down will you lose and data.

Thank you for all the reply guys it makes much more sense now.

I have tired the 486.9875 freq and wasnt able to pull anything up on that, but like you have mentioned its because i have to be close to the car to hear it.

This station is only a few blocks away from me thought listening to it might be fun but it does get annoying with the beeps coming in.

The time to recharge batteries is proportional to the amount of
charge that you have to put into the battery so a 2900 mAh battery
which is fully discharged would take twice as long to recharge as a
1450 mAh battery with the same state of charge.

I believe that programmed data is protected even in the absence of power.

Taking the batteries out of the unit will not erase the data on the scanner.

Yes the more mAh you have on the batter the longer it will take to charge but it also depends on the output of your charger the more mAh you got putting out the faster it will charge.

This goes out to all rechargeable batteries/devices.
When you wait til the battery is low and you charge it the longer the battery will stay charged and also will have a longer life span.

The scanner will not let the cells run all the way down. It will cut
them off at about 1.13V per cell. The scanner's data is retained. I've
had them run down until auto-power-off many times and never lost anything.

If you are charging them in the scanner, realize there is no sensing circuit
and that Charge Complete comes on based on the timer setting. You may never
be charging 2900mAh batteries completely in the scanner.

If you're driving, you're likely using the 996 model. Press the Scroll knob until it beeps (display shows FUNCTION HOLDING), scroll to the System (can take several minutes if need be), then press the digit (0-9). None of this is time-sensitive.

The 396XT is the same except for the location of the func button. But, it works the same. You can even make it one item per stoplight.

The typical caveat about operating anything while driving applies. ;->

2990. Re: Batteries

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-27 17:52:02 UTC
From: mobnj
Topic: 2982 Message: 2990

I hope this will help regarding charging the batteries. When compared to lower capacity batteries, a higher capactiy cell (a battery is made of multiple cells) will take longer to charge than a lower capacity (rated or measured in terms of milliamp-hours, mA-Hr) cell.

Since rechargable batteries are not 100% efficient in converting stored energy to power external devices and, said in another way, not 100% efficient at taking a charge from an external source to reverse the internal chemical reaction(s). That said, it typically takes about 14-16 hours to recharge a NiCd or NiMH (I believe) to fully charge the cell(s) which amounts to about 140% more energy put into a cell that has been fully depleted of its energy.

Keep in mind, however, that manufacturers don't really recommend discharging cells down to 0.0 Volts. To do so would likely result in that cell (or several cells if we're talking about a battery or battery pack) become reverse charged. Not healthy in terms of the cell's lifetime.

Instead, insure that whatever alarm is used doesn't allow you to deplete the cell below 0.9 (or better not to deplete any cell below 1.1-Volt to prevent such problems.

Thus far, I've provided information in terms of what is considered to be a "slow" charge or a "standard" charge which is 0.1 times the cells capacity rating (given in terms of mA-Hr). So, a 2800 mA-Hr cell would be charged at 280mA for 14-16 hours which is what the charging circuitry in the radio charges at/for. As was said below, that charger only tells you that it's been charging for 16-hours (I believe I read) but if you charge it at home over night for say 8-hours and unplug it to take to work to finish the job, you'd better have some kind of alarm to tell you to shut the charger down after 8-9 hours because the radio is thinking it's got a different battery to charge at the 0.1C (0.1 x rated cell capacity) for 16-hours. It does NOT remember what charging was done before you pulled the plug.

Another way to "skin" the potato is to buy one of the MAHA chargers that can charge much faster. No, I have nothing to gain by recommending their chargers but if you all have questions, let me know. I just bought their MH-C9000 which will charge any combination of AA or AAA cells (in any quantity from 1-4) INDEPENDENT of each other. That is to say that each cell is treated as a separate entity. Meanwhile, the computer inside keeps track of charging current, voltage, time, and heat production. In short, pretty much idiot proof. It is powered by AC or DC (12-V).

Mark's statement below about possibly not being sure you're completly charging the batteries is true BUT, as long as you monitor the time you've charged it you can stop it at any time by pulling the plug, waiting a few moments and then applyiing the power again for the remainder of the 14-16 hours. To be safe, charge them for 17-hours to allow for "topping" the charge. It's technically not a topping charge but it's similar and charging the cell for the full 17 hours (for example 5-hours + 12-hours equates to the 17-hours).

Might there be some fine points about this, sure but there would be NO harm done doing as I've said and the batterys will be essentially fully charged to the best of your efforts. Keep in mind, this is the simplest of charging techniques AND the safest and that's why the

charging circuit was designed the way it was.

If you want or need shorter charging times, buy a spare set always ready to swap one set out and replaced by the spare set.

Hope I've helped.

Ken

Actually Ken when you remove the charge plug, the internal timer resets it
does not resume.

2992. Re: Batteries

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-27 19:55:49 UTC
From: mobnj
Topic: 2982 Message: 2992

Mark, what I meant was that you could resume charging at the 0.1C rate. The internal timer would think that it's charging a different cell and would do so for 16-hours but on that second "leg" of charge on the same cell that had been charging for (to use my example below) 8-hours at home, the next day after disconnecting the charger, you'd only let it charge for a TOTAL COMBINED time of 14-16 hours (I'd personally go for 17 total). At the office you'd only charge that cell for another 8 or 9 hours and then turn off the charger or disconnect the power plug from the radio. I'm sorry if it wasn't clear.

Ken

From: Mark Levine, D.C.
Topic: 2982 Message: 2993

Well in any case, the external charger is still the way to protect and serve
the cells along with not risking the scanner.

2994. Low audio out of headphone jack?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-28 15:31:00 UTC
From: clovisb31
Topic: 2994 Message: 2994

I connected an external speaker to the headphone jack. Poor (as in low) audio. The internal speaker was louder. Thinking it was a stereo vs. mono issue I used a stereo to mono adapter...again no difference. Tried another "quality" speaker (Motorola) instead of the "Radio Junk" brand...same thing low audio. Anybody else try to connect an external speaker? Does the scanner just have sufficient audio out at the jack to only support an earphone? Huh?

2995. Re: [BCD396XT] Low audio out of headphone jack?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-10-28 15:38:54 UTC
From: MCH
Topic: 2994 Message: 2995

That's because it's a headphone jack, and not an external speaker jack.
It has audio levels sufficient to drive a headset without damaging your
hearing.

You will need to use an amplified external speaker.

The headphone jack is only limited to low watts the speaker inside the 396 im sure is rated no more then 10watts. Any thing more then a headphone will not work properly

I use the headphone jack and have hooked it up to my car audio and it works perfect.

I believe the jack was designed for an external
earphone. Use to be you could use an external earphone jack to drive a
speaker.....before bottom feeder lawyers got involved. Now,
manufacturers have to limit earphone volume, so users don't sue them for
damages. I guess lawyers never heard of PERSONAL RESPONSIBILITY.
We can thank lawyers for all those stupid warning labels
on just about everything from hair driers to firearms. Remember when kids
went to the bus stop to get picked up? Lawyers took care of that.....isn't
it fun getting stuck behind a school bus when they have to stop at every
kids house to pick up or drop off?
Ok, ranting off. Bottom line is: I think that's why
there is not sufficient volume to drive a speaker from an earphone jack. You
could try an amplified speaker.

Regards,
bob

OK...that all makes sense. My older handheld scanners seemed to drive an external speaker...this one aparrently won't. So...any recommendations on an amplified speaker. I don't have time and am too lazy to build one (not necessarily in that order).

Why re-invent the wheel. Do you have any old (amplified) computer speakers hanging around.

I think you said you tried a Motorola speaker. Motorola also makes
amplified speakers that will go loud enough you won't want to be in the
same vehicle. Get one before the lawyers find out! ;->

Hello,

The scanner comes equipped with a serial connector, not USB. You can use an USB to Serial dongle.

Each of the current and recent higher end Uniden scanners come with a serial cable, the USB-1 cable is an extra-cost option. Both cables will work on any of the scanners, including the BCD396T, BCD396XT, BCD996T, BCD996XT, BCT15, BCT15X, BC330, BC346XT and BC246.

You can also use a USB-serial adapter to allow you to use the included serial cable on a USB-only computer.

3011. ProScan 3.1 is here

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-05 02:33:50 UTC
From: bob_proscan
Topic: 3011 Message: 3011

ProScan 3.1 is here with the highly requested Find & Replace for the DMA scanners.

ProScan features includes:
Programmer and Database - Imports from the RadioReference Web Service (Online and CD).
Extensive History logging
Remote Control Scanner Over IP
Web Server - Listeners using a web browser can listen directly to your ProScan server
ScanCast - Streams audio to RadioReference / Icecast / ShoutCast servers
Full featured Audio Recorder
Band Scope (Spectrum Analyzer) (XT Scanner Series)
Control Channel Data Monitoring (XT Scanner Series)
Session Manager for managing many instances of ProScan on the same computer
ProScan supports the BCD396XT, BC346T, BCD996T, BCD396T, BCT15, BR330T, BC796D, BC785D, BC780XLT, BC296D, and the BC250D Scanners.

Version 3.1.0
Added - DMA scanners - Database Find & Replace
Added - Web Server / ScanCast - Custom Format Metadata
Added - XT Series scanners - Display unit ID option added to the General Settings in the database
Changed - Mute button mutes the incoming audio when the Scanner Over IP client is connected Instead of the server side scanner
Fixed - RadioReference incorrectly imported the location data (Latitude, Longitude, and Range) on the trunking sites
Fixed - Hangs during program loading on Win 7 64 bit OS
BCD996XT and BCT15X support will be in the next version 4.0.

_____
Bob
Taking Computer Aided Scanning to the next level!

In order to get discriminator audio you need to tap it, there should be a solder pad on the main board labeled DISC. Just tack solder a small wire there and run that to a jack of some sort (don't forget a ground and an isolation cap or resistor!)

Google around or check Radio Reference, there have been a few mods published where people modified an existing jack like the earphone or data jack to output the discriminator audio.

Personally though I would find a cheaper 800 MHz scanner like a PRO96, BC330 etc. and tap that, save the expensive 396XT for it's features and use a used, older radio for tapping. This also protects you from messing up a $500 radio.

Topic: 3013 Message: 3018

Thanks MUCH Rich! I have no plans on going inside the XT, I just thought I could get the discriminator output on the serial cable through the Control Channel Output function. My tapped Pro-96 is getting loaded down to the point where it's not working on the 800 frequencies if I use the tap, and I was just being lazy wanting to get the data out of the XT rather than going back into the 96 (it has a "straight" tap, no cap or resistor). Thanks again Rich. Dewey.

Subject: Re: [BCD396XT] Discriminator Output

In order to get discriminator audio you need to tap it, there should be a solder pad on the main board labeled DISC. Just tack solder a small wire there and run that to a jack of some sort (don't forget a ground and an isolation cap or resistor!)

Google around or check Radio Reference, there have been a few mods published where people modified an existing jack like the earphone or data jack to output the discriminator audio.

Personally though I would find a cheaper 800 MHz scanner like a PRO96, BC330 etc. and tap that, save the expensive 396XT for it's features and use a used, older radio for tapping. This also protects you from messing up a $500 radio.

> Ok, I give... what's the secret to getting the discriminator out of the 396XT (I know about the menu setting). I'm guessing it will be two of the pins on the serial plug, but which two? I've done searching using several search terms, but could not find any posts on the serial plug's schematics.
 Thanks in advance. Dewey.

3019. Quick Search Searches Too Fast ???

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-09 18:50:02 UTC
From: mobnj
Topic: 3019 Message: 3019

I've learned how to do Quick Searches but have discovered something that concerns me. I hope there's something I can do to increase the value of this feature for me. I'm not assuming it's a design problem. I'm hoping, however, that I have failed to consider something and hope you all will "open my eyes."

I stopped scanning and pressed "162." then "HOLD" then "HOLD" again to start the search. I "KNEW" the 396XT would land on 162.5500, a 5-bar+ signal from NOAA Weather near where I live. I say 5-Bar+ because I had tuned into that freq. and noted the DFQ (dead-full-quieting) station and the signal strength indication on the radio's display.

When I performed the Quick Search starting at 162.0000 (as set-up as mentioned above), the radio BLEW by ANYTHING and EVERYTHING from 162.0000 to 163.0000 ... without stopping.

I figured I'd have to lower my squelch threshold but, as it turned out, it was already just barely above the open squelch setting, so that wasn't it.

This frequency is just a FM (NB) transmission so, what is it/what could it be that allows me to hear the voice transmissions on that freq. when I MANUALLY select the channel I have it stored in, but can't get the radio to "discover it" in the Quick Search mode?

Note: When I press "HOLD" to stop the Quick Search and MANUALLY rotate the Select/Volume/SQL knob (click, click, click, etc.) on top of the radio until I land on 162.5500, THEN I hear it LOUD and CLEAR and again with a signal strength of 5+ bars !!

I hope you all can help me.

I agree, Mark. You are certainly correct about the fact that if the radio is being recharged and you pull the power plug, the charging stops. I think we all understand that. If the radio had charged the batteries for 10-hours when it's power plug had been removed, and re-connected once you got home (let's say), you'd need to keep track of the duration of this additional charging procedure so that you don't over charge the batteries much (presumiing the individual cells were measured at 0.9 to 1.1 Volts/cell which is about as low as they should be allowed to be discharged before recharging is begun) until the total time charged is about 14-16 hours.

3021. Re: Batteries

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-09 19:18:22 UTC
From: mobnj
Topic: 2982 Message: 3021

I would agree, it's handy, nice and easy to utilize the internal charging circuitry along with the external power "cube" but when you can both afford the cost and the cubic volume (the size) of an external charger that's just about idiot proof, I decided to purchase the MAHA MH-C9000 WizardOne Charger-Analyzer. I felt it was/is justified in everyway to both insure I get the max. usage/life out of the batteries I use, insures that no matter where I am (mobile or home, etc.) as long as I have a source of Line/Mains Voltage or Automobile cigar-lighter socket, I can keep/charge any number of cells charged. It will do all that it can do (lots of modes, features) for any number of cells from one (1) to four (4) cells and do it independently for EACH cell. I could charge 1-cell, 2-cells, 3-cells, or all four at a time (even though the Uniden 396XT only uses three (3) AA-cells. It will charge NiCd or NiMH AA cells.

Now, if you have need of charging more cells or differing sizes (AA, AAA, C, D, 9-Volt Rectangular, etc.) take a look at their website: http://www.mahaenergy.com

By the way, I make nothing for mentioning this unit/company. I'm just telling you what I did and why.

For those of you that would want/need to charge in the car, that cable is an zccessory and costs about $9.95 list but I went to my local Radio Shack and found a couple of their parts to make my DC power/charging cable.

Maha also offers 2700mA-hour AA cells so yes, I purchased two sets of 4 at 12.99 each (USA). Each set came with a handy holder for the cells.

Anyone using rechargeable batteries for their cameras (other than Li-ION chemistry types), cassette recorders/players, portalbe CD-players, etc. SHOULD give this sophistocated charger/analyzer a GOOD look and consideration for insuring you get the most out of your battery investment with little to no thinking, counting, etc.

Could be a few things. Make sure the Broadcast Screen is not enabled. I think that affects the search, too.

Also, are you searching in Control Channel Only mode? If so, the scanner will only stop on control channels.

Also, was the attenuator enabled? That should not take a 5 bar signal to nothing, but you never know.

Also, was the attenuator enabled? That should not take a 5 bar signal to
nothing, but you never know.

Joe M.

mobnj wrote:
> I've learned how to do Quick Searches but have discovered something that concerns me. I hope there's something I can do to increase the value of this feature for me. I'm not assuming it's a design problem. I'm hoping, however, that I have failed to consider something and hope you all will "open my eyes."
>
> I stopped scanning and pressed "162." then "HOLD" then "HOLD" again to start the search. I "KNEW" the 396XT would land on 162.5500, a 5-bar+ signal from NOAA Weather near where I live. I say 5-Bar+ because I had tuned into that freq. and noted the DFQ (dead-full-quieting) station and the signal strength indication on the radio's display.
>
> When I performed the Quick Search starting at 162.0000 (as set-up as mentioned above), the radio BLEW by ANYTHING and EVERYTHING from 162.0000 to 163.0000 ... without stopping.
>
> I figured I'd have to lower my squelch threshold but, as it turned out, it was already just barely above the open squelch setting, so that wasn't it.
>
> This frequency is just a FM (NB) transmission so, what is it/what could it be that allows me to hear the voice transmissions on that freq. when I MANUALLY select the channel I have it stored in, but can't get the radio to "discover it" in the Quick Search mode?
>
> Note: When I press "HOLD" to stop the Quick Search and MANUALLY rotate the Select/Volume/SQL knob (click, click, click, etc.) on top of the radio until I land on 162.5500, THEN I hear it LOUD and CLEAR and again with a signal strength of 5+ bars !!

With the release of the updates, just want to remind you to ask your questions in the open forums. I currently have limited internet connectivity (for the next 10-12 hours, I will have no access to Yahoo! groups or email). Lots of folks on the boards who can help you out with the common issues that arise with performing the update. It could take me days to respond to a direct request for help.

Thanks Dick, you the man as always. I should have know it was a twiki page. Firmware went without a hitch and is working great. I did uninstall the firmware utility and didn't' have to. If you used the firmware installer from the previous firmware update you don't need to download the firmware installer.

I updated as well and tried to test it. According tot he documentation, you have to enable it on the scanner. See below:

The Unit ID (UID) feature lets you see the unit ID of the radio currently transmitting on Motorola, EDACS, and APCO P25 systems. To see the Unit ID, you need to first turn on the global Unit ID option in the Settings menu.

1. Press MENU.
2. Scroll to SETTINGS and press E/yes.
3. Scroll to Disp. Unit ID and press E/yes.
4. Scroll to On and press E/yes.

When turned on, in Display Modes 1 and 2 the scanner will alternate the current channel information and the Unit ID information in Line 2 of the display. In Display Mode 3, the scanner will display the Unit ID information on Line 3 of the display.

If you program a Unit ID into a channel, you can assign an Alpha to the Unit ID. You program a Unit ID just like an iCall ID (press ./no then the Unit ID).

Yes, the update was good. I noticed that it only works with trunking systems though. Not on conventional channels. I could be mistaken but thats what I got on my radio. I really like this group, there is just so much to learn on this radio that it makes me even happier to own it.

I installed the updates with no problem. I wonder of someone can explain the real value of the unit ID feature. I only monitor two trunked systems, one a mass transit system (BART) and the other a distant Police system. I see the numeric unit id when the mobile unit transmits -- but what does that accomplish for me ?

I'm not trying to be provocative, just seeking information...

What kind of conventional channels? Analog channels don't have UIDs.

Joe M.

3042. Re: [BCD396XT] Use of Unit IDs?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-10 19:16:12 UTC
From: Wadie E. Suttles III
Topic: 3037 Message: 3042

For what its worth, the unit ID's will have a great use for public safety entities. Here's an example. I am a career firefighter. My apparatus is Quint 2. Quint 2 has a mobile radio and 4 portable radios. These portable radios are addressed as Quint 2A (Officer in charge), Quint 2B (Driver/pump operator), Quint 2C (Nob or tank man) and Quint 2D (Plug or hydrant man). The mobile is addressed as Quint 2, which is the driver/pump operators radio designation. Even though, Quint 2B is also a designator, in an operation scene, Quint 2B will only be called if I am not commited to the apparatus. All apparatus throughout our department has the same lineup. My wife has a 996XT at home. If while on duty, I have a fire, my wife knows me as Quint 2B or Quint 2. But now that the unique unit ID features are an addition to the scanner, she can now see, Quint 2B, when I transmit, versus Fireground 1.
I do agree that this feature may not benefit everyone or every system. But it is a start for many more features to come. And since fire operations can really get enormous at times, it will benefit those who are fire buffs or have family within the department, that likes to keep up with a specific apparatus or member. My wife already appreciates the thought that she doesn't have to guess my radio comms, she can see my comms and know that its me. I just hope I never have to use a "MayDay.

3044. RE: [BCD396XT] Use of Unit IDs?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-11 16:03:53 UTC
From: Dan Danz
Topic: 3037 Message: 3044

if you have a friend or relative and know his/her radio ID, you can program it to display the person's name.

If you're sleuthing a new system, it lets you see how the users of that system switch talkgroups. If the users have multiple trunking systems programmed into their units, you can even spot them on the other systems (the UID will be in a range that it is different than the normal range for that system) …

>

It depends on the use of the system. In some systems, the radio IDs are assigned almost randomly (i.e. whatever unit needs a new ID gets the next available number), and some systems have very logical number ID plans. Being able to ID the unit transmitting can be very useful - especially if you are familiar with the system.

Bob,
Are you saying that you setup one conventional P25 freq. as a "P25 one freq trunk system"
and it works with the latest firmware and the "Radio ID" displays some info. ?

Clark

3050. BCD396XT Prices

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-12 00:29:10 UTC
From: BradD
Topic: 3050 Message: 3050

I've updated the BCD396XT Prices table in the Database section of this group. Feel free to add/update. This is based strictly on a web search today. I did not verify/validate the prices with any of the sellers.

I'm hoping that Santa might slide one under my tree this year! :)

Not sure what Bob was saying, but that's what I said. If it's a
single-channel trunk system, it will show the UIDs and TGs. If it truly
is a conventional frequency, you won't hear anything.

Thanks Joe,
That's what I thought. I setup a LAPD single, conventional frequency as a single TRS, and it wont scan
as it's not a control channel. Nothing happens. What Bob said was confusing to me.

From: MCH
Topic: 3053 Message: 3054

When you need it, it will be shown in your scanner. MENU, SETTINGS, SEE SCANNER INFO, FIRMWARE VERSION. The ESN is on the third line, and the Checksum on the left side of the last line.

However, since you're not performing a Major Version Update, you won't need that info. I know you're not doing that since there is only version 1 for the XT series.

Understood. FWIW, there is no control channel data on some of my local
single channel trunk systems either. That's why I didn't think they were
single channel trunk systems. On some of them, there are TGs and UIDs.

It's interesting that some Government systems have a UID of "1" on
several radios. I imagine that's so you don't know how many units there
are. :-) At least part of our government is still thinking.

3057. Re: Use of Unit IDs?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-12 03:36:03 UTC
From: bigfella237
Topic: 3037 Message: 3057

You are forgetting that conventional P25 channels transmit radio IDs too and can have talkgroups instead of NACs?

If there is no CC data broadcast then it isn't a TRS.

The multiple RIDs of "1" simply mean that whoever wrote the codeplug either didn't know about RIDs on P25 or didn't bother changing the default value (of "1") in CPS?

From the Motorola CPS help screen:
==========
Individual ID
(ASTRO System, General)

DEFINITION:

Selects the unique Id for the current ASTRO Signaling system. This ID is unique for each radio in the system and is used for both voice and data signaling operation.

ACCESSED ONLY:

When the radio is model/option capable.

SELECTIONS:

Minimum = 1

Maximum = 9999999

The factory default is 1.
==========

3059. I.D. Search in Scan Mode

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-12 03:34:54 UTC
From: mikkut
Topic: 3059 Message: 3059

What a fantastic group, a tremendous resource! I'm very close to purchasing the 396XT and I would like to confirm a couple of things with folks who already have one:

1 - I see that when programming trunk systems, they can be set for either I.D scan or I.D. search at the system level. If I have a system set to I.D. search, will it stay in I.D. search when the scanner is in scan mode (http://info.uniden.com/twiki/bin/view/UnidenMan4/AvailableOperationModes?sortcol=table;up=#Scan_mode) or does being in scan mode override the system I.D. search setting?

2 ☐ If the system I.D. search setting is independent of scan mode, can different trunk systems that are simultaneously enabled have different I.D search and I.D scan system settings from each other (similar the open/close setting for banks in the PRO96) or does one override the other?

3 ☐ When a system is set to I.D. search and is receiving a transmission on a TG that has a text tag programmed in that system, will the text tag display or just the TG number?

4 ☐ Will enabling/disabling systems using SQKs work the same regardless of whether or not the scanner happens to be on a trunk system set to I.D search at the time the SQK is pressed?

Thanks!
Mike K

True, but they are not trunk systems if they really are conventional. In
my case, they really were single channel trunk systems.

If your point is that the scanner should be able to display UIDs on
conventional P25 channels, you may be correct.

The set mode is the default. Changing the mode 'on the fly' changes that
setting.

> 2 ? If the system I.D. search setting is independent of scan mode, can different trunk systems that are simultaneously enabled have different I.D search and I.D scan system settings from each other (similar the open/close setting for banks in the PRO96) or does one override the other?

Each system is independent. You can have X Systems in ID SCAN, and Y
other Systems in ID SEARCH.

> 3 ? When a system is set to I.D. search and is receiving a transmission on a TG that has a text tag programmed in that system, will the text tag display or just the TG number?

If the TGID is programmed in memory with a text tag, it will show the tag.

> 4 ? Will enabling/disabling systems using SQKs work the same regardless of whether or not the scanner happens to be on a trunk system set to I.D search at the time the SQK is pressed?

SQKs are completely independent of the mode. It doesn't change the mode
and systems set either way can use the SQK. When re-enabled, the mode
will be the same as when it was disabled (unless you change it via the
menu in the mean time).

All of these comments from my experiences are quite true, however I have never seen any conventional P25 user that do not have a TG, even if it is always TG1 they all have it. I have experience with two types of P25 radios. Even if you leave the default setting of NONE for TG ID it will still show up as "1". So conventional channels *usually* have a RID,TGID, and a NAC.

Rich

True, but as far as the XT scanners are concerned, the conventional P25 systems will not show any TGIDs.

Again, I'll say if your point is that the scanner should be able to display UIDs (or TGIDs) on conventional P25 channels, you may be correct. It will show the NAC and show it, but it does not show anything else.

3066. RE: [BCD396XT] Re: Use of Unit IDs?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-12 07:41:15 UTC
From: Robert Klamp
Topic: 3037 Message: 3066

As an example I have it set up for the FPS Police in chicago and i get both unit ids and talkgroup info, the fun thing with these P25 Single frquency systems is if it is transmitting data over only one tg id on the channel we now have unit ids to label so you will know who is talking for the chicago area,
FPS Police Chicago:
406.7000 NAC 293 DISPATCH
406.2000 NAC 293 UNIT TO UNIT
TGID 4085 MEGACENTER DISPATCH
TGID 1 FIELD UNITS
but now with the unit ids you can program and name the individual units instead of just monitoring the tgid and not knowing whos talking.

Hope this clears up my statement,
Bob

True, but as far as the XT scanners are concerned, the conventional P25 systems will not show any TGIDs.

Again, I'll say if your point is that the scanner should be able to display UIDs (or TGIDs) on conventional P25 channels, you may be correct. It will show the NAC and show it, but it does not show anything else.

Unit ID displays just like my $3000 MaCom EDACS unit. Thanks Paul & Uniden!
As
for multiple units displaying as "1" or any other number: some systems
(such as mine) will only program unique IDs for those who need them.
Others get a "common profile" with a common ID instead.

OK I have tried to look for this but can't figure it out how do you enable or disable group quick keys (GQK) the way I read it and please correct me if I'm wrong but you have to hit the function button then the number for the GQK you want to enable or disable

Well on some of my systems it scans though them so fast I can't seem to hit the function then the number fast enough?

Suggestions

2nd questions is there a way to hold on one trunk and search that trunk for activity? (Maybe I should say and easy way)
The only way I can figure out at this time is to lock out all my other stuff and leave it on one trunk setup as search but this is a bit of a pain.

3075. Re: [BCD396XT] New with BCD396XT (GQK)

Yahoo group: BCD396XT (2008 — 2010)

Topic: 3074 Message: 3075

Second answer first. Hit HOLD while scanning that System until it beeps.
That activated the System Hold function and will only scan that System.

For the first one, you can hit FUNC, scroll to the System you want, then
hit the GQK.

Yes. I agree with you 100%. Also beware of using Freescan to program Single Channel Trunked systems. Mine do not work when I use Freescan to load them.

True, but as far as the XT scanners are concerned, the conventional P25 systems will not show any TGIDs.

Again, I'll say if your point is that the scanner should be able to display UIDs (or TGIDs) on conventional P25 channels, you may be correct. It will show the NAC and show it, but it does not show anything else.

Thanks Paul,
I was aware of those three options but for some reason, I was thinking the XT also had an option as
in the T model. As in a trunk system either the TG or the Alpha tag was displayed.
Display mode 2 (XT) will be OK as it displays the Alpha tag, now alternating with the Radio ID, and the TG on the next line.

3086. DCS codes, normal and inverted

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-13 21:21:50 UTC
From: W4KRR
Topic: 3086 Message: 3086

Can I assume that the XT scanners (and all Uniden scanners) ignore whether a DCS code is normal or inverted? IOW, as long as I have the correct DCS code selected, I will hear the conversation, no matter if the transmitted DCS code is normal or inverted.

Ken

From: MCH
Topic: 3086 Message: 3087

Not a simple question by any means. :-)

Answer 1: You have to have the correct code in order to receive the transmission. If you've programmed 023, and they use Inverted 023, you will not hear them.

Answer 2: There is no such thing as an 'inverted' CDCSS code. By that statement, I'm talking about the fact that every "inverted" code is the same as a different "Non-Inverted" (AKA Normal) code. Inverted 023 is the same as code 047. So, if someone says they are using 023I, they are really using CDCSS 047, and that is how it should be programmed in your scanner. BTW, yes, it works both ways - Inverted 047 = Normal 023.

So, you can program your scanner without the need for "Inverted" codes.

Why are there inverted codes? Well, some receivers used high side injection and some used low side injection (and many still do), and the type used would literally invert the waveform upside down from the others. So, "inverted" codes were used to transform the code in these receivers "right side up" again.

Your scanner is smart enough to know what it receives, as are modern Two-way radios, so the "Inverted" code is a dinosaur that continues to linger in terminology.

3088. Re: [BCD396XT] DCS codes, normal and inverted

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-13 22:04:41 UTC
From: MCH
Topic: 3086 Message: 3088

Oh, and to help you identify "Inverted" codes, they are usually written
in the form:

023I (I for Inverted)
as opposed to
047 or 047N (N for Normal) or D047 (D for Digital)

Also, your scanner will always show the Normal code, and never the
Inverted code, as again, it's really a "myth" in today's world.

3090. Re: [BCD396XT] DCS codes, normal and inverted

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-14 02:37:59 UTC
From: Dan Danz
Topic: 3086 Message: 3090

Joe:

Fascinating. Never heard of Inverted DCS codes before. Now, I don't doubt what you're saying, but how in blazes did you get from 023 to 047.

These are supposedly octal digits (0 thru 7) so in bits 023 base 8 is 000 010 011. Supposedly the inversion occurs because FSK marks became spaces and vice versa. If I invert each bit as in 111 101 100, I get 754 as the inverse.

Similarly, 025 -> 752, and 031 -> 746, etc.

What am I missing?

I had the same question so I did a Google search. I suspect that the
following web page will tell you all you want to know and then
some. Get out your propellor beany, this gets a bit involved. I
sure hope that this isn't going to be on the mid-term exam. ;)

3092. Re: [BCD396XT] DCS codes, normal and inverted

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-14 05:59:06 UTC
From: MCH
Topic: 3086 Message: 3092

The code is 23 bits (I think) not 9. You have to count the checksum bits and the framing bits (AKA sync bits), and lots of other bits. If the link Richard Victor posted is the one I think it is, it will tell you anything you want to know about the format.

Basically, you have to invert all the bits then shift them. That's why there are only 104 codes and not 512 as there are in a 3-bit octal number. They make sure that it's not possible for any code to be misinterpreted via shift of the bits. Actually, it's surprising they can get 104 out of only 5 times the total possible.

So, in short, you're missing the 'rest of the code'.

Wow !

I asked for a drink of water and Dick turned on the fire hydrant, but after a thorough soaking I now understand. Thanks for the reference, Dick.

Most enlightening.

3094. iCall Feature

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-14 16:07:06 UTC
From: therealgeo
Topic: 3094 Message: 3094

Howdy, everyone!

Did I miss something, or has the ability to enable / disable the iCall feature on a per-system basis go away with the release of the 1.08.14 firmware pack?

I run my 396XT in ID SEARCH mode a lot to catch new TGIDs on the Sarpy County system here in Nebraska. Since iCalls are pretty common at times on this system, I'd like to disble them system-wide and only run ID SEARCH mode on regular TGIDs.

Thanks!

George B.

You're welcome, Dan.

Makes one really appreciate the Internet when you can type "inverted DCS" into a search engine and find an answer like that in a fraction of a second. Understanding it took me a lot longer. :)

And then lock out that channel which, I believe, should accomplish what therealgeo is trying to do.

Wading through the horrible twiki documentation for the 996XT I can not find any reference to how to turn on CC Auto Store or designate which system should be used to store any hits.

I sure hope that someone at Uniden has plans to write a real user manual for this scanner !!

Neil Bell

As I said in the other group, MENU, then Close Call, then select the Autostore option.

From: therealgeo
Topic: 3094 Message: 3101

Howdy, guys!

Thanks for the replies. The other piece of info I forgot to mention is that I program my XT with ARC-XT software.

Would I first program a TGID with i0 (i ZERO) to enable, then lock that TGID out in order to disable iCalls for the entire Sarpy County system?

It was much easier when ARC-XT had the iCalls "On" or "Off" option - a lot easier to understand!

3102. RE: [BCD396XT] Use of Unit IDs?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-15 04:52:58 UTC
From: Clayton
Topic: 3037 Message: 3102

That makes more sense. They are not actually 1 channel trunked systems, they are conventional channels with Talk groups and RID's programmed. You are just programming them as a single channel TRS in the scanner.

My P25 radio is conventional only, but can be programmed for different talkgroups and RIDs. We use the default talkgroup and alpha tag the RIDs to identify who's transmitting.

In some cases, that is because the tech does not know what he is doing. Some government techs have very little training, and simply clone all the radios off the first one that made to work. I know from experience

Understood. FWIW, there is no control channel data on some of my local
single channel trunk systems either. That's why I didn't think they were
single channel trunk systems. On some of them, there are TGs and UIDs.

It's interesting that some Government systems have a UID of "1" on
several radios. I imagine that's so you don't know how many units there
are. :-) At least part of our government is still thinking.

Easier, maybe, but duplication. There is no reason why SW cannot
continue to operate that way, but simply program the scanner as the
'harder way'. Although I don't think programming channels is any more
difficult than turning something on and off in a menu. With the channel
method, you have access to all the channel options which you don't have
with the menu item.

There has to be a difference. Some of them work trunked, and others do not. Those that work must be doing something to allow trunking. Those that do not work as single channel trunked systems have to be Conventional channels.

Again, I had some I thought were Conventional that work fine programmed as trunked. The only explanation I can come up with is that they are single channel trunked systems. I would entertain any alternative explanations.

3105. Re: [BCD396XT] Use of Unit IDs?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-15 07:17:16 UTC
From: Richard A. Victor
Topic: 3037 Message: 3105

Isn't a single channel trunked system an oxymoron? It would seem
that a trunked system is a system that uses some type of controller
to assign conversations to different frequencies to increase the
amount of traffic that can be handled on those frequencies. If you
only have one frequency, then you can't be doing that.

I realize that there can be TGs on such a system, but isn't that
merely another way of doing what we used to do with CTCSS/DCS, i.e.,
sort things out so that one only hears those things that one
wants/needs to hear? I'm not seeing how such a system provides
greater efficiency or increases the amount of traffic that can be
handled on a limited resource.

That said, I'm not suggesting there aren't good reasons for such
systems, merely that they aren't really trunked systems.

While this is stated as an assertion, it's really a question.

I can't say about any other types of systems, but Motorola SmartZone trunking does support single channel sites. It's called Voice on Control. When there is no voice activity, the one channel transmits control channel data. When a conversation is assigned on that one channel, the control channel data goes away and the voice conversation takes place on that same channel. When that conversation is completed, the one channel returns to being the control channel. Obviously it would be used only on VERY low use sites. It would allow a trunked user to continue to operate trunked when he roamed to that site without the user having to do anything different. That is unlike a single channel conventional site that would require the end user to change channel on his radio.

Neither of the SmartZone systems that I have run for a living have used VoC, but they would have supported it has we wanted to build a single channel site using VoC. The SCE system did have two 2 channel sites on their SmartZone, but no trunked single channel sites.

No, it just makes it easier for the end users to use - not having to change channels to use that site. Also giving "normal" access to the talkgroups that they would normally use.

> That said, I'm not suggesting there aren't good reasons for such

Pretty limited situation, but there are some out there.

3107. CTCSS/DCS vs NAC search in Close Call

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-15 07:51:04 UTC
From: Jim Walls
Topic: 3107 Message: 3107

I seldom use Close Call, but earlier this evening I had a need to determine the NAC of a channel that was programmed into a radio that is installed in a vehicle I use. I had the frequency, but not the NAC. Since my 396XT was close at hand, I figured that this was one of the few reasons for me to use Close Call. Enabled Close Call and then keyed up the transmitter. The scanner quickly found the channel, but would not decode the NAC. Hmmm, maybe not turned on. So I checked and sure enough the scanner had CTCSS/DCS search enabled in Close Call. Changed it to P25 NAC search and keyed up again and quickly got the NAC.

Now the question (for Paul, I assume), why do I have to select either CTCSS/DCS search OR NAC search? Since an analog frequency found in Close Call will never use a NAC, and a P-25 channel found will only have a NAC, why can't I simply have CTCSS/DCS/NAC search with options of on or off?

I can't answer why, but the same thing is true with a programmed
frequency. If you designate the audio type as "All", you can't
search for either the CTCSS/DCS or the NAC. You have to designate it
as either "Digital Only" to search for NAC or "Analog Only" to search
for CTCSS/DCS. It's too bad that it's that way since in some cases
one doesn't know which it will be and one ends up programming the
frequency once as digital with a NAC search and again as analog with
the CTCSS/DCS search. That can be problematic if it's scanning in
the "wrong" direction when the channel becomes active.

All of this would have been pretty obvious to Uniden, so I assume
that there's a pretty good reason why it wasn't done in a way that
would have avoided this problem.

I hadn't thought of the convenience for a user to be able to roam
without changing the radio. Still it seems that he's only simulating trunking.

3110. Firmware upgrades

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-15 15:31:27 UTC
From: James F. Boehner, MD
Topic: 3110 Message: 3110

Just upgraded my BCD396XT to the latest firmware version after finding out about it on this list.

I have registered on the Uniden/my website and (I thought) on the twiki website. I have not been able to find out how to be notified about firmware changes automatically, as the twiki site suggests. Under the 396XT entry, there is no mention of upgrading to the latest firmware.

Paul or anyone-what do I need to do to be notified of changes automatically? I was happy to find that the firmware upgrade file existed, but since the BC-VUP program has changed several times, I just want to make sure that I am using the right version of that program.

Perhaps a change to the uniden.com/my website to check for firmware updates?

TIA!

At what SYSTEM menu level would that be entered?
If it is the GROUP level, will it need to be entered
in each GROUP?

Thanks,

As I understand it, it's a hardware limitation. Although I don't see why
the firmware could not switch back and forth until it gets a valid
decode of 'something'.

I had that same argument quite a while ago, but it seems there are trunked systems that are single channel and do not transmit the control channel data between the voice.

That's one of the reasons I thought some of my local traffic was Conventional. I found out otherwise.

It provides an entry level low-cost means to switch to a trunk system.
As more users are added, more channels can be added.

Since it's entered as a TGID, you need to enter it in an active group
in each system where you want to hear I-Calls. If you enter it as
the only TGID in a separate group with a separate GQK, you can turn
it on and off at will.

OK, that makes sense. I guess it's cleaner than trying to do the
same thing with CTCSS/DCS.

Thanks.

Dick

It also defeats 'evesdropping' and makes it impossible to key up over an existing conversation.

From: Richard A. Victor
Topic: 3037 Message: 3121

Seems like if I think of it as "New and Improved CTCSS/DCS" it works
better in my head than if I think of it as trunking.

Perhaps that's just my hangup, but it seems to work better for me that way.

Thanks for the education!

Dick

Topic: 3107 Message: 3122

GREs must have "better hardware" :) , they will decode either PL/DPL or NAC in search. Probably a different chip or different implementation.

As I understand it, it's a hardware limitation. Although I don't see why the firmware could not switch back and forth until it gets a valid decode of 'something'.

Or they are just switching back and forth as I suggested. Not sure if
the hardware is the same or not.

But, that is one of the advantages GRE has over Uniden currently.

I would have to say that is about 98%, but not 100% true. It's true for scanning TGs, but if they are involved in I-Calls, you should be able to scan them as was stated.

3130. recommendations for a mobile antenna

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-18 15:25:22 UTC
From: w2edv
Topic: 3130 Message: 3130

Hi Everyone,

I'm the proud new owner of a 396XT and plan to use the unit in my car. I wish to mount an external multi-band antenna on the passenger side of the rear hatch on my Subaru Forester. The driver-side on the rear hatch is the home of my VHF/UHF transceiver stick.

I've seen the Austin Spectra:

http://www.rfwiz.com/AustinAntenna/AustinAntennaSpectra.htm

and was also looking at the Comtelco antennas on the same site. The Spectra looks capable enough, but I've come across references that it can be a bit fragile. My hope is to employ a multi-band antenna (Spectra=4) so I can use the entire Rx frequency range of the scanner (25-1300MHz).

Does anyone have any recommendations as to a good multi-band scanner antenna? The above site appears to have the best price for the Spectra. I plan to mount whatever NMO antenna I get to the hatch using a Diamond K412SNMO, which is very similar to hat I use for my vhf/uhf antenna. It's adjustable in 2 dimensions.

thanks in advance,

73
w2edv

I use a LARSEN 150/450/800 mobile antenna and am very satisfied with the results. If you receive 800 mhz stuff though I'd be sure and use the low loss coax & the 800 NMO connector, otherwise you won't receive there as well. I switched over from a LARSEN 5/8th wave VHF and was worried about losing some VHF signal but I hardly notice any difference. I even have a useable signal on one VHF LO base frequency that's thirty miles away.

Mike -

Are you saying there's a specific 800mhz NMO mount? Do you have a part number for it?

Thanks,

The mount by itself is LARSEN part "NMOHF" (High Frequency) You can order this with 17 feet of "DS" (double shield) coax under part NMOHFDS. They have lots of different configurations with end connectors. Check out this link and look under page 169 for the mount and the subsequent pages for coax/connector options.

3138. RE: [BCD396XT] recommendations for a mobile antenna

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-18 23:36:09 UTC
From: Clayton
Topic: 3130 Message: 3138

I have to second Mike's approval of the Larson, I wasn't expecting too much when I bought one at a hamfest, but I have been very impressed by its performance. I also have a Maxrad that is very similar, and it performs very well also. Because of their size, they are a little weaker on VHF-Lo, but otherwise they will hold there own with anything I've tried.

Subject: Re: [BCD396XT] recommendations for a mobile antenna

I use a LARSEN 150/450/800 mobile antenna and am very satisfied with the results.
If you receive 800 mhz stuff though I'd be sure and use the low loss coax & the 800
NMO connector, otherwise you won't receive there as well. I switched over from a
LARSEN 5/8th wave VHF and was worried about losing some VHF signal but I hardly
notice any difference. I even have a useable signal on one VHF LO base frequency
that's thirty miles away.

I read thru' the PDF and it says the HF mount is for applications for
freq above 1.7ghz.

That seems to be a little overkill for 800-900mhz - doesn't it? :)

3140. Re: [BCD396XT] recommendations for a mobile antenna

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-19 10:44:27 UTC
From: Michael Bennett
Topic: 3130 Message: 3140

Somewhere I read that this mount was for applications of "800 and above". Not sure where that was since it doesn't appear to be listed in that particular catalog. I use a magnetic mount with an 800 mhz antenna which has the standard NMO mount and coax and it seem to receive okay but I haven't made any comparisons so I'm not sure how much the difference is.

3143. Re: recommendations for a mobile antenna

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-19 19:29:02 UTC
From: w2edv
Topic: 3130 Message: 3143

Thank you all for your replies. I ordered the Larsen tri-bander and a Diamond NMO mount. After I ordered the mount, however, I realized I might have erred in that I probably shouldn't mount the Larsen on my rear hatch, as my TM-D710 transmits on a Comet dual-band stick on the other side of my rear hatch (the 2 antennas would be ~5 ft apart). I transmit APRS packets as I drive, so the TX is keyed every couple of minutes. I may desense the 396XT.

So, I will wait to receive the Diamond mount (K412SNMO)and eyeball it to see if I can use it on the lip of the hood. If I can, great; if not, I'll return it to Universal and order a more suitable mount. When I called this morning, Universal had already shipped it, so I might need to go the RMA route.

From: Larry Koch
Topic: 3144 Message: 3146

Go to "settings" then "See Scanner Info" then "Firmware Version." The serial # is the 3rd line down..

3147. I-Call Problem

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-20 23:30:17 UTC
From: policescannernut
Topic: 3147 Message: 3147

Today I was running a BC796D with my BCD396XT. Both radios were scanning pre-programmed I-calls. My BC796D stopped on a particular radio ID yet my BCD396XT did not. I put my BCD396XT on "Hold" and manually tuned to the channel it was programmed into and heard radio traffic. I put the BCD396XT back in "Scan" mode and it would not stop on that channel. That channel on the BCD396XT was NOT locked out. What could be wrong? Would appreciate any help!

3148. Re: [BCD396XT] I-Call Problem

Topic: 3147 Message: 3148

A couple of possibilities come to mind:

1. Do you have the I-Call wildcard programmed and enabled in the XT?

2. Do you have those IDs in a Group that is disabled?

3149. Firmware Upgrade Issue

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-21 22:19:52 UTC
From: billf88
Topic: 3149 Message: 3149

Hello,

I am trying to upgrade the firmware but it keeps failing with a checksum error message. It proceeds to upgrade but in the end I always get the Checksum error message. I have the usb-1 cable and have correctly loaded the driver so it's recognized correctly. I have tried the slowest baud rate without success. I've tried redownloading the upgrade program and the firmware upgrade with no success. I've disconnected the USB-1 cable and the power cable and retried installation at least a dozen times without success. Now I got a brick for a scanner. Any suggestions?

I am using a Lenovo laptop running Windows Vista Ultimate.

Thanks,
Bill F.

Hello,

I understand you are in a difficult predicament but I will ask if you unzipped the firmware upgrade file. BC_VUP will happily go ahead and try to do the update whether you feed it the right file (unzipped) or the wrong one (zipped).

Don, KE4JD

Hi and thanks for your reply. This is a Motorola Analong and I have three groups set up with this. All three groups are active and their numbers are visible in the display. Group 1 is police/fire dispatch,and works fine. Group 2 is police private calls (the one that is not working), and group 3 has fire private calls (which is working). In group 2 there are 45 private calls programed with channel 1 having the wild card i00000. That wild card channel is only locked out. If I manually scroll to it, the redio traffic is alive and well. If I scan that group, all private call channels are silent unless I manually scroll to that active channel. Could there be a bug in the programming or setting wrong just for that group?

Thanks for your help!

Marvin

Hello again,

I did a little research into this problem and it appears to be related to a bad download of the *.scn file. In the case I was looking at the person had to download 4 times to get a good upgrade.

I looked at the error for trying use an unzipped file and it was not the one you are seeing.

Hope this helps.

Hi Dan,

Thanks for your help. I made sure the firmware file was unzipped before it was loaded into the upgrade program. I don't think it's the download but I can download it from another computer to test that out. Thanks for your help.

3155. RE: [BCD396XT] Re: I-Call Problem

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-22 21:30:56 UTC
From: Dewey
Topic: 3147 Message: 3155

I can not confirm this for the x96's because I haven't tested it, but on the 250's, it was almost impossible to lock out I-Calls from the "i00000" wilcard, because pressing L/O on an I-Call only locked out the current RID. If this operation is the same on the x96's, the only way I can see to successfully lock out I-Calls where the wildcard has been programmed is to lock out the Group that contains the I-Call wildcard. Of course, I reserve the right to be wrong.

Dewey

3157. Re: [BCD396XT] Firmware

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-22 23:45:10 UTC
From: Richard A. Victor
Topic: 3156 Message: 3157

You download the BC_VUP program as well as the actual firmware file. Both are in zipped files. You unzip both. You then install the BC_VUP software. When you run the program that you have installed, it asks for the location of the unzipped firmware file. If all goes as planned, it then loads that firmware into the scanner.

The firmware doesn't run on your computer. It is merely stored there until the BC_VUP program can transfer it to the scanner. When you unzip it, the unzipped file will be stored on your computer. It will have a file extension of .scn.

In other words, BC_VUP gets downloaded, unzipped, installed, and run. The firmware gets downloaded, unzipped, and transferred to the scanner by BC_VUP.

You're talking about while scanning. You can lock out
i00000 in the menu or via SW and it will lock out them all.

Yes only the channel 1 in group 2 (which has the wild card) is locked out. The remaining 44 private call channels in that group 2 are not locked out and when there is radio traffic on these, scanning will not stop.

How I was able to lock out channel 1 (wildcard) was by going into program mode and drilling my way into group 2 channel 1 and select the lock out option. Program System > System Name > Edit Group > Select Group > Edit Channel > Select Channel > Set Lockout > Lockout.

Thanks,

Marvin

You're giving the scanner conflicting info which it is resolving in a
way other than what you would prefer. You're telling it you don't want
to hear any I-Calls (by locking out the wildcard), but then you
'complain' that it's not receiving the I-Calls.

To fix this, unlock the wildcard or delete it.

I wonder if it is possible to add a menu in the programming to see all programmed system/sites and be able to select a system/site in/out of the active scan list. For someone like me that uses the 396XT only when I need its features like digital radio traffic. So far in the greater SoCal (L.A./Orange county) area not much digital trsffic, Yet.

The menu has a feature to scroll through the Systems (Menu, PROGRAM SYSTEM), and has the ability to lock or unlock that system in the System-specific sub-menu (or under the Site as appropriate).

3166. 2 days old - no P25 - any ideas?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-23 08:44:43 UTC
From: torontokris
Topic: 3166 Message: 3166

Got a 2 day old 396xt and there is no P25 sound.

I see P25 come up and hold during the full transmission but I hear nothing (just a click when transmission starts and almost very faint static - not the garbled digital noises)

played with all the P25 settings as well as the "hold power on" advanced settings.

ERR rate showing originally as 4 8
I got it down to 0 or 1 by playing with the advanced settings.

Analog TG on the same control channel works perfect (rules out the speaker or receiver) .
Digital has a STRONG signal,
shows P25 (not enc)
Bandplan is correct
Programming is correct (working perfect on other 396xt I have without any adjustment), and also re-programmed by hand and using another software package
updated to the latest firmware
re-set the scanner

any ideas?

thanks

Incorrect programming? Many times, people mis-program a system that is
not P25 as one that is. Which State/County/System are you monitoring?
Also which TG are you having this problem on?

You might want to chat with Upman as he may be interested in this issue.

First thing I would try would be to remove the batteries (I've heard as short as 5 minutes and as long as 24-48 hours) and see if things come back to normal.

Hang loose. I may arrive soon. It is coming to many areas., especially large metro areas. Chicago area and surrounding areas is all P25 digital. Here in St. Louis City, only the city is P25, but hopefully coming to others.

I-Calls are call made from police Motorola Type IIi Systems. They usually are police calling a complainant about why the called the police. Mainly. Sometimes they are police calling police just to bitch to each other or call their wife and say "what's for dinner" or "are you in the mood". Very interesting stuff to listen to. Are you in the St. Louis, MO area?

First, I-Calls are NOT specific to POLICE systems. Second, they are not specific to Motorola Hybrid. They can be implemented on Type II systems as well. For that matter, they are also available on EDACS.

I-Calls allow two individual radios to communicate. Instead of the conversation being on a talkgroup that everyone can hear, the conversation is just between the two radios.

David, the original poster asked what they were. He is not interested in your slighted take on what they are used for.

Many entities have valid uses for I-Call. For example, Myrtle Beach PD supervisors use them to talk to their patrol officer. They use it very effectively that way. I-calls also work great for traffic control of a section of one-lane road during contruction.

I dont think its the programming. faulty P25 card or CPU im thinking

Im in Toronto Canada... having a problem with everything digital, not just one talk group or one system.

ALL digital talkgroups have this problem, Both a Moto type 2 mixed mode and a P25 system. VHF UHF & 800 conventional.. nothing.

exact same programming was put into a 3 other 996xt and 3 other 396xt's and all others worked perfect right away no adjustments needed.

Programmed from both radio reference and by hand in search mode in both ARC and freescan.

I just checked it is definitly a motorola type 2 smartzone system program it as motorola type 2 and it should all work very nicely for you look it up on radio reference. http://www.radioreference.com/apps/db/?sid=537

Its all there and more. Just because the royal canadian mounted police transmit in p25 the system has analog users as well it is a type 2 system not pure 100% p25

Beyond making sure the channel type is set to Digital or Both, you should also confirm that you are using the latest firmware.

A hardware fault is not out of the question.

3177. RE: [BCD396XT] 2 days old - no P25 - any ideas?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-23 18:50:57 UTC
From: Richard A. Victor
Topic: 3166 Message: 3177

Since he's got it working on at least one other same model scanner,
it seems unlikely that he misprogrammed it on this one. He also
refers to an analog TG on the same control channel working correctly
so it appears that he's aware that you can have a P25 transmission on
a Motorola type system.

Lighten up a little there Frank. He meant well.

In relation to i-calls ... A few days ago I monitored what I think was an i-call to i-call transmission. On my screen was something that looked like this ......

i-1000467 -- i-1000784

Those were not the actual numbers because I did not write them down. Does anyone know what that may have been?

jeff

First, I-Calls are NOT specific to POLICE systems. Second, they are not
pecific to Motorola Hybrid. They can be implemented on Type II systems as
ell. For that matter, they are also available on EDACS.
I-Calls allow two individual radios to communicate. Instead of the conversation
eing on a talkgroup that everyone can hear, the conversation is just between
he two radios.
David, the original poster asked what they were. He is not interested in your
lighted take on what they are used for.
Many entities have valid uses for I-Call. For example, Myrtle Beach PD
upervisors use them to talk to their patrol officer. They use it very
ffectively that way. I-calls also work great for traffic control of a section
f one-lane road during contruction.
Frank
---- David Nordmann <davidnordm@...> wrote:
I-Calls are call made from police Motorola Type IIi Systems. They usually
are police calling a complainant about why the called the police. Mainly.
Sometimes they are police calling police just to bitch to each other or call
their wife and say "what's for dinner" or "are you in the mood". Very
interesting stuff to listen to. Are you in the St. Louis, MO area?

My apologies. I was just trying to ensure that the original poster got accurate information.

You post below does look like an ICall. Radio 1000467 initiated a call to radio 1000784. Over time, you will notice (maybe) some patterns. One example I've noticed is:

On the Summit County, OH radio system all the Akron fire rigs have consistant radio IDs. Radios in the range 3602-3613 are the mobile radios on the corresponding med unit (3606 is med 6). 32xx are the Engine mobiles. 30xx are the one of the batallion radios (can't tell mobile or portable). Of course, that pattern is not used anywhere else in the department or county from what I can tell.

What would really impress me is; if someone were to combine a high-end All-Mode receiver with the bells and whistles of the 396 / 996XT's , yes, I know adding a BFO and the many DSP filters etc.. would make an outrageous price tag on it, but wouldn't that be a piece of pure art? And top it off with a really nice GUI , not like the ones for the XT line now, but like the high-end HF rigs have for PC control? But I guess I need to wake up from the dream of that huh? Still a nice thought.

All it will take is for us to figure out the business case to show Uniden and ICOM that if they work together to design the ultimate radio that combines the Uniden BCD396XT with the Icom IC-746PRO that more then just you and I would purchase such.

But, then I would ask, I already have the
two BCD396XT's and one ICom IC-746PRO and I can and do computer control of the three radios + from the same computer and can do things with these two radios that might not be possible if they are designed into one.

Thanks.......and Keep Safe!

BCD396XTIs there any way to make the scanner show what fq it's receiving on a close-call reception without having to push a button?

I find it a major pain to have to push a button to both show the fq and/or clear the close-call condition. You would think it would just come up and show the frequency automatically, and then continue, once the transmission was over, just like a regular channel reception . . . Is there any way to make it behave that way?

If you can't believe it, then don.t

But, it IS the truth. Digital is expensive not counting the licensing
that is a VERY significant portion of the increase in cost.

Could they make it cheaper? Yes, but only until they were sued for
copyright infringement and they would no longer be making scanners.

It's not just scanners that cost more. Two way radios are in the same
boat. When you could get away with analog only you could get radios for
under $500. Now, you can't get a P25 radio for less than about $1500.
While it cost $50-75 for a typical repair before, it now costs almost
$500 JUST FOR THE REPAIR!

But, hey, digital is the latest and greatest, and everyone has to have
it, so if you think the cost is too high let your municipalities know.

No, there isn't. I believe it's a patent issue that another company has
the patent on automatically displaying a frequency found via a nearfield
device.

So, as with the P25, there are legal/licensing issues that come into play.

yes! they are just telling you they are I-Calls from police to police or police to complainant. It is part of the Motorola Type 2 IIi trucked system.

First, I-Calls are NOT specific to POLICE systems. Second, they are not
pecific to Motorola Hybrid. They can be implemented on Type II systems as
ell. For that matter, they are also available on EDACS.
I-Calls allow two individual radios to communicate. Instead of the conversation
eing on a talkgroup that everyone can hear, the conversation is just between
he two radios.
David, the original poster asked what they were. He is not interested in your
lighted take on what they are used for.
Many entities have valid uses for I-Call. For example, Myrtle Beach PD
upervisors use them to talk to their patrol officer. They use it very
ffectively that way. I-calls also work great for traffic control of a section
f one-lane road during contruction.

St. Charles County Sheriff's Department is P25 digital as well. Not sure what they're going to do in 2013 though...the consultants they hired to design their new system a year or two ago built it on frequencies which cannot be narrowed! They're going to have to completely replace their entire system in a few years to be compliant with the FCC mandate (how stupid was that?? Geez!). Anyway, they are easy to monitor and the majority of their transmission are on their P25 system (they still have one or two analog channels to communicate with the other St. Charles County agencies). Their signals are strong, both dispatching and in the cars, so you may be able to hear them even where you are!

What do you mean "frequencies which cannot be narrowed"? Why do you think that they can't be narrowbanded? If you are talking about St. Charles County in Missouri, it looks like a good part of it already IS narrowbanded.

Another thing to keep in mind. Their FCC license specifies a maximum modulation, not a required modulation. Therefore, you can even narrowband using an existing NBFM license without violating it.

Well, I just have a lot of experience in this area and I know the FCC rules in the matter. Most of those changing to narrowband (SNFM) will be doing so on the same frequencies.

I imagine that when (dare I even say IF) the cutoff date comes about, people will just receive license renewals with the maximum modulation lowered to 11.0 kHz from 16.0 or 20.0 kHz.

Oh, and why do I say "if"? Well, I see a lot of spectrum becoming a ghost town for a lot of reasons, and I honestly foresee an effort to forego the mandated narrowbanding due to changing circumstances and changed administration. The demand for spectrum is not as high as it used to be. At least, not the same spectrum that is affected.

Only a portion of the frequencies are narrowbanded right now. And, the rest cannot be. I can't explain why, but I know from one of the most respected radio system people around here and elsewhere (He has, for over 20 years, very successfully designed & implemented radio systems for counties and other states) that this is their problem.
But they do have a way out...Several months ago St. Charles County (MO) passed a tax issue to put in a new, county-wide system for all the entities...that being for not only the county but also the cities within (St. Charles, St. Peters, O'Fallon, etc.) (purpose being interoperability). It will include fire/EMS as well. So this will take care of any problem St. Charles County Sheriff's Department has - if the system is operable by 2013. (Then again, rumors continue to grow that the FCC will, once again, push back the 2013 date.)

Hi Joe,

Yes, I believe that was exactly the case they were originally going to try to make with the FCC. I'm not sure what the initial response was back but there was some "discussion". But it's all moot now since the new countywide system will be going in. Many believed it should have been designed with frequencies which could be easily narrowbanded. At the time it was speced, there were available frequencies which could have been applied for and weren't. That was a big part of it.

Are they on Low Band?

There is no reason any frequency could not be used for a narrower band modulation other than the fact Low Band narrowband equipment is very rare. Even then, the frequency could still be narrowbanded.

[Snip] Hang loose. I may arrive soon. It is coming to many areas., especially large metro areas. [Snip]

Very true, any government or volunteer organization that wants federal funding for a radio system upgrade, must purchase "digital capable" equipment. This doesn't mean that they have to use the equipment in digital mode, but if a state or municipality eventually replaces all of their old analog radios with digital ones why wouldn't they run them in digital mode?

This is true of non government organizations as well. Many Amateur Radio Emergency Service (ARES) groups are going to D-star equipment, in order to get FEMA grants for their equipment. My ARES group just uses our new equipment in analog mode.

I don't think that it is such a good idea for EVERYONE to go digital but our all knowing federal government does, and is pushing pretty hard for it. Oh, well.

Chris

3206. mix ups with the electronic serial numbers

Hi all i think a few people got mixed up in here and were trying to help me with registering my 396 xt, i was just replying to the other guys post in here that needed help registering his, i myself registered mine back in may, and it seems like it was really never registered, the reason is because i got mixed up doing it before, because if anyone tries and goes to enter the serial number on the uniden page it starts like this 359Z, and my scanner when i go into the settings mode to find the serial number does not show a z in the settings, and if anyone looks on the uniden page when you go to register youre 396 xt it will show a letter Z belonging to the serial number, so if anyone goes and tries to register there 396 xt you should not try to find the serial number in the settings mode, i used those numbers and they did not work, for some reason the numbers on the back of my scanner are different than inside the settings mode, so all this time i never got any firmware updates or anything else that came out new, why the scanner does not show all the numbers or letters i dont know ? anyone else had problems with this ? but i did re register mine with just the numbers on the back of the scanner hopefully its right now.

The physical S/N is on a label on the scanner and starts with 359Z (but that is already filled in for you on the web site).

The Electronic Serial Number (ESN) is accessed through the menu as described, and starts with 35926 (but that is already filled in for you on the web site).

While I'm sure that it's a good idea to register your scanner, you
don't have to do so to receive notice of the firmware updates nor to
actually download the updates. You can subscribe to the What's New emails at:

http://info.uniden.com/twiki/bin/view/UnidenMan4/WhatsNew

and you can check for new firmware updates at:

http://info.uniden.com/twiki/bin/view/UnidenMan4/ScannerManuals

Good morning Joe,
No, they're on VHF. But, as mentioned in the previous post to Jim Walls, the entire St. Charles County area (now along with St. Louis County and very likely several others) will be moving to a new radio system (most likely p25) which will solve any problems they have right now. For the time being they're fine and, as you pointed out in your previous post, and as we've been hearing for well over a year or more, there have been more and more rumors about the 2013 mandate being pushed back again or perhaps something more.

Here they are Joe:

155.49000 RMF 293 NAC (Narrowband) P25 Dispatch
155.83500 141.3 PL (Analog) Law TAC
156.00000 (Analog) Law Tac
156.00000 141.3 PL Digital P25 Law Tac
156.33000 Tactical (Tact 1)
153.90500 Tactical (Tact 2)

(As listed in Radio Reference and as they are in my 398XLTs)

Almost all of those can be narrowbanded. I'm not sure about the 156.330 MHz frequency, though. That is in the Marine band, I believe. The rest are standard Public Safety frequencies and there is no reason why they cannot be used for narrowband operations.

There are too many dealers out there trying to sell people completely new radio systems in bands different than where they are now. This looks like yet another example. They could switch to narrowband analog and continue to use the same towers, antennas, feedline, and in many cases even the same radios with mere reprogramming. BUT, the dealers make more money off selling new systems, so they make some lame excuse as to why they have to buy the new system.

If they are being told they cannot narrowband their current frequencies, I would recommend they call the FCC directly.

3213. RE: [BCD396XT] Re: Things I would like to see

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-25 23:50:07 UTC
From: Clayton
Topic: 3164 Message: 3213

There was recently an article in the paper about one of the smaller suburbs of Kansas City "needing" a new digital system because some "experts" had examined their radio ops and told them the only way to have reliable communications was to spend millions on a new digital system. Among the reasons was the mandate to use narrowband, supposedly making their conventional VHF channels obsolete. Funny thing is, they are already narrowband, and they just installed a new repeater and went narrowband a couple of years ago. I suppose the new 300' tower included in the new system is going to make more of a difference than buying digital radios. You're right on the money Joe, salesmen and consultants are more interested in selling high dollar systems than taking care of their customers.

Clayton

Can't explain why, Joe. I'm not an expert but know from one there were problems and also know they spent a lot of money for the current system which wasn't going to be able to meet the mandate. (It's moot now, with the new system coming in.)

I've never quite figured out what 156.330 was though. It falls within the parameters of the marine band but it isn't designated as a marine channel. I have little doubt it's marine-related. St. Charles County abuts several miles on the west side of the Missouri River, as St. Louis County does on the east. But St. Charles County covers a larger area than we do. All operations (for both counties) are handled through fire/rescue and St. Charles County has quite a bit more equipment and personnel designated for water rescue. I haven't heard any activity on that frequency, but honestly haven't paid close attention either.

This wasn't a dealer, wasn't someone selling them anything! It was a man who is a friend and someone who is extremely knowlegeable and respected within the industry. He lived in the area, they asked if he could come in and talk to them a year after the radio system had been installed because they were having some problems. He did it at no cost and NOT as a consultant, but because he lived in the county and wanted to help. This was anything but a sales call, someone trying to sell something, etc.!

I agree! The vast majority of consultants I've come into contacts with were idiots.

But in this case it wasn't a consultant - had nothing to do with consultants!

Some of the marine frequenciess were used for other services before being assigned to the marine band. Users who were on those frequencies were able to continue to use the frequencies (they were grandfathered in). However, they probably aren't going to be able to make license modifications and keep the frequency. There might also be a time limit on how long they can continue on the frequency...I'd have to do more research. It is possible that the FCC is requiring them to vacate the channel concurrent with their move to narrowbanding, which could be what your friend picked up on.

Subject: [BCD396XT] Re: Things I would like to see

Can't explain why, Joe. I'm not an expert but know from one there were problems and also know they spent a lot of money for the current system which wasn't going to be able to meet the mandate. (It's moot now, with the new system coming in.)

I've never quite figured out what 156.330 was though. It falls within the parameters of the marine band but it isn't designated as a marine channel. I have little doubt it's marine-related. St. Charles County abuts several miles on the west side of the Missouri River, as St. Louis County does on the east. But St. Charles County covers a larger area than we do. All operations (for both counties) are handled through fire/rescue and St. Charles County has quite a bit more equipment and personnel designated for water rescue. I haven't heard any activity on that frequency, but honestly haven't paid close attention either.

<.....Kansas City "needing" a new digital system because some "experts" had examined their radio ops and told them the only way to have reliable communications.....>

The term "reliable communications" can have a much broader context. In our case, St Joseph, MO, the driving force for the new system was reliable communications among the various public safety providers. Our system includes our police, sheriff, city and rural fire departments, ambulance service, university security, jail, drug task force and hospital security. Almost all radios have the capability of communicating with the primary talk group of all other agencies plus there are several interop talk groups available on every radio.

Our goal was to have processes and procedures in place that support "reliable communications" between ALL agencies which is much broader than just hardware.

Larry

PS: I'm not defending consultants...but I'm thinking about starting a consulting service to defend consultants from those who think most consultants are idiots. :-)

The only thing it could have been is that their equipment was not
capable of narrowband operation (which means it is very old).

3220. Firmware Upgrade Issue

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-26 20:59:22 UTC
From: Billf
Topic: 3149 Message: 3220

Hi Everyone,

Thanks for your help with this firmware issue I am experiencing. I have tried updating the firmware 5 more time again without success and I have unzipped the firmware update file again and redownloaded and unzipped again. That's not the issue and I am still receiving a checksum error message at the end of the upgrade process.
So, the question now, is how to I get this fixed by Uniden?

Thanks,
Bill F.

Topic: 3221 Message: 3221

Would anyone please venture a guess as to whether the BCD396XT will be able to monitor a Project 25 system when Phase II occurs? Thanks.

Maybe you can list what you're doing step-by-step?

Do you have more than one scanner that could have a different ESN?

The next version of P25. It will use TDMA to allow for multiple users on
the same frequency.

After the upgrade process, I received a message that the firmware failed and there's a checksum error. This leaves the scanner unusable. It won't boot up. the screen is blank. It's a very expensive brick. I have upgraded it in the past with success but this upgrade has left it as a brick.

Thanks,
Bill F

What? You've upgraded it in the past? The firmware update was only
released a couple weeks ago, and I think there has only been one update.

I don't believe that you need the ESN for any of the upgrades that
have been released so far for the 396XT. If the OP is entering it,
that may be the problem.

Thanks Joe for your input on this. I am concerned because our local PD and FD will be moving to the P25 system as part of Phase II by 2013.

I haven't been able to find out much regarding how it will affect the current crop of receivers, or whether an update for them might be possible. All I found was a mere mention of Phase II in the Radio Reference Wiki:
http://wiki.radioreference.com/index.php/Project_25

I maybe should wait a little longer before shopping for my next toy. Darn!!

That makes sense, Paul. St. Charles County Sheriff's Department has been around a long time, so it's reasonable that they could have had the frequency for quite a while.

With an entirely new, county-wide p25 system approved by the voters a few months ago, they won't need to worry about it any longer. But previously it was concerning that they weren't told anything about a problem before or during the time their consultants were designing and putting the new system in place a couple of years ago.

--- In BCD396XT@yahoogroups.com, Paul Opitz <pmanu44@...> wrote:
>
> Some of the marine frequenciess were used for other services before being assigned to the marine band. Users who were on those frequencies were able to continue to use the frequencies (they were grandfathered in). However, they probably aren't going to be able to make license modifications and keep the frequency. There might also be a time limit on how long they can continue on the frequency...I'd have to do more research. It is possible that the FCC is requiring them to vacate the channel concurrent with their move to narrowbanding, which could be what your friend picked up on.

> >
> > I've never quite figured out what 156.330 was though. It falls within the parameters of the marine band but it isn't designated as a marine channel. I have little doubt it's marine-related. St. Charles County abuts several miles on the west side of the Missouri River, as St. Louis County does on the east. But St. Charles County covers a larger area than we do. All operations (for both counties) are handled through fire/rescue and St. Charles County has quite a bit more equipment and personnel designated for water rescue. I haven't heard any activity on that frequency, but honestly haven't paid close attention either.

Larry, if you could do it and show various departments and other agencies consultants who really do know what they're talking about, and are able to follow through, you'd be much sought after! I won't go into detail, this isn't the place nor the topic. But I do know there are good consultants out there, I just haven't had the opportunity to work with them yet and I'd welcome it as I know many others would!

answered my own question on wikipedia here it is for all to see from wiki

P25 Phases
P25-compliant technology is being deployed in several phases:

Phase 1
Phase 1 radio systems operate in 12.5 kHz analog, digital or mixed mode. Phase 1 radios use Continuous 4 level FM (C4FM) modulation for digital transmissions at 4800 baud and 2 bits per symbol, yielding 9600 bits per second total channel throughput. Receivers designed for the C4FM standard can also demodulate the "Compatible quadrature phase shift keying" (CQPSK) standard, as the parameters of the CQPSK signal were chosen to yield the same signal deviation at symbol time as C4FM while using only 6.25 kHz of bandwidth.

A hand-held Project 25 radio used in US systems.
Vendors are currently shipping Phase 1 P25-compliant systems. These systems involve standardized service and facility specifications, ensuring that any manufacturers' compliant subscriber radio has access to the services described in such specifications. Abilities include backward compatibility and interoperability with other systems, across system boundaries, and regardless of system infrastructure. In addition, the P25 suite of standards provides an open interface to the radio frequency (RF) subsystem to facilitate interlinking of different vendors' systems.

Phase 2
To improve spectrum utilization, Phase 2 is currently under development with concurrent work being done on 2-slot TDMA and FDMA (CQPSK) modulation schemes. Phase II will use the AMBE vocoder to reduce the needed bitrate so that one channel will only require 4800 bits per second.
Significant attention is also paid to interoperability with legacy equipment, interfacing between repeaters and other subsystems, roaming capacity and spectral efficiency/channel reuse. In addition, Phase 2 work involves console interfacing between repeaters and other subsystems, and man-machine interfaces for console operators that would facilitate centralized training, equipment transitions and personnel movement.

 Sometimes my life IS a jerry springer show!!

What it is saying, as a part of the spec, is that a P25 radio will receive and transmit digital or analog. Also they will do mixed mode, so it can be programmed to receive digital and analog on the same channel. This makes a P25 radio "interoperable" with "legacy" analog systems.

Understood, but it's poorly worded since it says Phase I is analog. It should be saying that Phase I is digital but allows for radios to use analog non-P25 channels. It also doesn't say that it allows for operation on 16 kHz analog channels, which most legacy systems are.

It's no wonder with info like that people are mis-programming systems as P25 when they are not. The WIKI implies that they are P25 systems.

3245. Consultants

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-11-26 20:21:32 UTC
From: Derek Helling
Topic: 3245 Message: 3245

Thanks Larry:

i'm a consultant, have been one for about 30 years. Most folks are uneducated on the subject and tend to revert to broad pejoratives, indicating their ignorance.
Like any other profession or pass time there are good and bad, smart and not so smart, etc., etc., participants; just like astronauts and scanner enthusiasts.

Happy Thanksgiving.....Derek Helling

<.....Kansas City "needing" a new digital system because some "experts" had examined their radio ops and told them the only way to have reliable communications. ....>

The term "reliable communications" can have a much broader context. In our case, St Joseph, MO, the driving force for the new system was reliable communications among the various public safety providers. Our system includes our police, sheriff, city and rural fire departments, ambulance service, university security, jail, drug task force and hospital security. Almost all radios have the capability of communicating with the primary talk group of all other agencies plus there are several interop talk groups available on every radio.

Our goal was to have processes and procedures in place that support "reliable communications" between ALL agencies which is much broader than just hardware.

Larry

PS: I'm not defending consultants. ..but I'm thinking about starting a consulting service to defend consultants from those who think most consultants are idiots. :-)

The next version of P25. It will use TDMA to allow for multiple users on
the same frequency.

From: gcr33
Topic: 3249 Message: 3249

Is there any chance some of you with 396xt files might share some of them here?

We have a files section with hardly anything in it.
Let's make it easier for those that are traveling with the holidays coming up.

I have posted mine and updated it.

3250. Re: Project 25 Phase II

I think this only involves P25 systems, and hopefully it won't affect you or very many others anytime soon. Unfortunately, the system I care most about is P25 (with Phase II coming in a couple years). Since my next radio will be a Uniden handheld, it would help me to know what's in store for those in my boat (whether an upgrade to the current model is possible, or if a future model is planned).

Actually, it won't be another $500, as your XT should be worth at least
$400 when they come out and I would expect the new model that does Phase
II (assuming it won't be possible in the XT) to be around the $500 mark.

So, it will be approximately a $100 upgrade - less if you can get more
for your XT.

Keep in mind that many systems will likely stay with the existing P25
format, so it's not as if all P25 systems will be upgraded - just as not
all analog systems upgraded to P25.

Another perspective:

For those saying their systems will be upgrading to Phase II: This could be a good thing for the XT scanners if it's that easy. If the radios can be upgraded via firmware, there is a good change the XT scanners can be, too.

Conversely, if the XT scanners will require different hardware, it is likely that the existing radios would as well, which means it's much less likely a system will convert to Phase II (hence less likely to need another scanner).

You can download directly from RR into FreeScan. My preference when I need recording capablilities and more involved logging is ProScan. There is also ARC-XT. Both of the pay programs have free trials so that you can see if you like them before shelling out any money.

This is a good explanation. I know that Johnson County, Iowa is purchasing a P25IP system from Harris that can easily be upgraded to Phase II.

If this is the case as Joe has already mentioned, then it likely is as simple as a firmware upgrade.

I highly doubt Johnson County (Iowa City is the largest city, home of the University of Iowa) would buy a system and then shell out millions more later to upgrade.

They would have waited and purchased a Phase II system.

Maybe Paul from Uniden,
Who reads this list will set the record straight
on the ability of the XT scanners to be upgraded P25PhII.
if and when it does happen.

I just cannot think that the $$$ we folks spend on the latest scanner goods here, that these will be obolete at the push of some newer firmware by the 2way folks at some later date in time.

I would think the marketing gurus at Uniden have already thought of this senario already.

Paul can you chime in here on this big question,
Are our current model XT scanners able to do the P25 Phase II,
if and when it deploys, with a flash upgrade?

Many Thanks in Advance

Bob Brown

And maybe whilst Paul is at it whilst I know he is in the U.S. he can tell us forgotten people down here in the country down under and forgotten about (Aust) by Uniden if we are going to see the XT here in Australia any time soon.

Our current stock of Digital scanners is being run out and there is NO talk of any replacement at this stage if it goes the way it is heading Australia will have NO scanners available to the general public inside 12 months.

Wouldn't the government love that :-(

Regards
Mav.

Actually, we have one that has been in testing phase for a couple months now, and is scheduled to go fully online next week. Prince George's Co, Maryland wlll be going from a conventional 490s system to a 700 MHz P25 TDMA/FDMA system. Here's the PG P25 RR link:
http://www.radioreference.com/apps/db/?sid=6341

And here's RR thread where we've been talking about it and preparing for it:
http://forums.radioreference.com/maryland-radio-discussion-forum/156820-pg-countys-p25-system.html

I'm ready to beta test...

Dewey

Maybe Paul from Uniden,
Who reads this list will set the record straight
on the ability of the XT scanners to be upgraded P25PhII.
if and when it does happen.

I just cannot think that the $$$ we folks spend on the latest scanner goods here, that these will be obolete at the push of some newer firmware by the 2way folks at some later date in time.

I would think the marketing gurus at Uniden have already thought of this senario already.

Paul can you chime in here on this big question,
Are our current model XT scanners able to do the P25 Phase II,
if and when it deploys, with a flash upgrade?

Many Thanks in Advance

Bob Brown

And it works with RR if you're not a subbed member (only not via direct DL).

Don't use ARC from Butel. Free trial period doing evals for my boss, downloads inconsistent with each cycle, file size different!

Proscan is amazing and gets my vote.

I think you'll find differing opinions when asking. I will easily and readily admit that Butel's ARC has its bugs, but it is **my** favorite **paid** software. I have used ARC250Pro, ARC396Pro, and I am currently using ARC996Pro and ARC-XTPro. I really miss bcTool since it doesn't have XT support yet, but I still use it with the 996. I also enjoy using Freescan. What I like most about ARC is it's ability to manage each system separately. This allows me to easily move systems in and out of my default profile, or have multiple profiles while only having to edit a system once. In bcTool and Freescan, if you have more than one profile that uses the same system(s), that/those system(s) will have to be updated in each profile. I still prefer bcTool and Freescan, but this is the reason I use ARC.

Again, this is only personal opinion, but here is what I like about the software that I use:

> bcTool - I think this has the most customizable audio and log file output. I run it almost everyday for unattended scanning on the 996T, which scans 52 separate systems.

> Freescan - I love it's ability to keep the data between my 996T and 396XT synchronized. I will do my programming in ARC-XT, send the programming to the 396XT, download the 396XT with Freescan, and upload the Freescan file to the 996T.

> ARC-XT - This is what I use to do my actual programming and downloads from RR. Again, it is my preferred software for initial programming and saving the system files **independently**.

> Proscan - Not knock it, just didn't find a use for it (I have demo-ed it).

Bob, That is how the 2 way folks make money, continually bringing out new technology. Of course, they are going to push everyone to buy the latest and greatest. Just like folks that have to have the latest Iphone or Blackberry for cellphone use. I don't think Uniden has much control of this as they have to work with the technology that is used in the marketplace. I would think they would have to wait until the new technology is certified to determine if there could be an upgrade or if a completely new scanner is required. The main thing is that hopefully the new technology will be able to be scanned. I guess we are all in the same boat and will just have to wait and see what develops.

Forgive me if someone has asked these questions before. I try to stay up-to-date with the posts, but I don't get them all.

1. Is there a way to do a search and have the tones (ctcss, dcs) display on the screen as each new fq is found?

2. Is there a way to change what the display looks like when it's received a CC? Why does it make you push a button first to see what the CC capture was? Can it just display the CC right away upon receipt? The pushing of a button seems like a needless extra step.

Thanks everyone!
Scott

Yes. Set the audio to ANALOG ONLY and set the CTCSS/CDCSS option to SEARCH.

> 2. Is there a way to change what the display looks like when it's received a CC? Why does it make you push a button first to see what the CC capture was? Can it just display the CC right away upon receipt? The pushing of a button seems like a needless extra step.

I've always suspected it was to get 'around' a patent that someone has
on a device that automatically displays the frequency of a nearfield
hit. That's never been confirmed, nor do I think it will ever be, but
that's my hunch. Hence, you need to press a button first.

Hi Matt,

Everyone will have their own favorites. You basically have 3 to choose from. ARC-XT, FreeScan, and ProScan. I have all 3 and would use different products to achieve different things based on the strengths of the different software packages. My personal favorite is ProScan. With the enhancements provided over the past few months I find I can do almost everything needed with this one package. I also favor the ProScan UI.

Hi Dewey,
Looks as though your Prince George CO, MD P25 TDMA/FDMA System is getting off to a good start! Even a schedule now in place to begin the changeover starting this month - Wow!

I hope you give us updates as to how much you're able to monitor and I'll be especially interested in how well the system is working. Here in St. Louis County, and surrounding counties, there will be new radio systems going in over the next few years. I have little doubt it will be based on this technology. Thus I'm interested in how well it's working up there!

Shell

Oh, and P.S. Will adjoining counties and agencies be able to communicate with Prince George County once the new system is fully operational?

I've also been reading that this system is proprietary for now, meaning that no scanner will be able to track it on the TDMA side as it is currently configured. Not to mention this is only system of it's type, that will eventually be converted to the completed phase II standard sometime in the future.

TDMA is an interesting concept for truniking:

True, but patches can even be made to CB channels from a technical standpoint, so I never count patches as a valid answer to "Can A communicate with B" questions. Patches can link anything.

3280. Re: Software

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-01 16:58:17 UTC
From: Gerry
Topic: 1512 Message: 3280

All depends on how much programming you do. If you constantly tinker with your programming, travel a lot and reprogram for every trip, etc., then by all means spend money on a program if you think the features justify the expense. I've used BuTel in the past for a couple of my radios, and I think they're good. But I just don't reprogram enough to make it cost-effective.
That's where FreeScan comes in. It does just about everything the higher-priced software does, it's no more "buggy" (and the developer issues upgrades as needed,) imports from RR and other programs, and if you simply want to program and forget it, IMHO it's your best choice. Best of all it's FREE, or low cost if you choose to donate a few $.

Hi, all.

Sorry It's taken this long but I just don't get enough "goofin" time with this hobby but I finally got to it and read-up on what the Broadcast Screen is, etc. and then took a look and found that you all, particularly, you UPMan, had suggestions. Sure enough, when I understood how that feature works (like a screen to keep out the flies but in this case to keep out/greatly attenuate signals you don't want to interfere with your scanning/searching, etc. I need to do more reading about the features and try to understand better how some features affect other aspects of the hobby (some in a good way and some that may cause you grief so if you make changes and then find something doesn't work the same as it did before the changes, it's time to read more).

The attenuator thought was also good but I didn't feel that would be the case but I still checked it to make sure. When you get something as sophistocated as this radio, you can't assume you'll understand everything right away. In fact, that's one of the really great things that I LOVE about it. It's a hobby that you learn more about radios, antennas, new words (attenuation, squelch, channel, groups, trunking, etc.) and communications (propagation, line-of-sight, Amplitude Modulation, Single-Side-Band, etc.) I love anything that allows me to use the hobby right away but find new features/facets for as long as I own the radio.

Excellent Job, Uniden! This is quite a leap from my very first Bearcats (base, mobile, handheld, crystals, etc.) and boy oh boy is it GREAT at doing what I paid my hard earned dollars for. Great value!

Time to read more. I'm a ways before using the trunking feature but I'm not frustrated by that fact.

Thanks again to you all for jumping to try to point me in the direction of a probable cause of my difficulty.

Ken, what you need to do is experiment and then you'll know how it works. Your not going to break it. You can always back up your programming with FreeSCAN and then re-initialize your radio if you mess things up then reload what worked the last time. If you need it, to re-initialize your radio press and hold 2,9, and Hold, power on the scanner to re-initialize the Memory and restore the Preloaded systems. When it asks do you wish to restore the preloaded systems press the E/Yes key otherwise ". No" to just clear the programming. WARNING This will erase any personal programming you may have done to your DMA.

Did you look at the preloaded systems? One of them could be close to you and already include the Trunked system nearby: http://wiki.radioreference.com/index.php/BCD396XT#Preloaded_Systems_and_their_System_Quick_Keys

Take a look at the article that UPMan wrote on how to set-up your systems: http://www.grove-ent.com/SCANNERPROGRAMMING.htm

Hello everyone. Just joined group and just got my BCD396XT last Wednesday. A little background...I have been using Scanners for the last 15 years or so, but very simple ones. I want to cover some frequency ranges my others can't (mainly for storm chasing - I have never had a scanner/2 way radio with me on chases in the past). Of course this new one is a little more advanced than I can handle right now but I figured why buy a cheap one then buy this one two years down the road.

That said, I have it programmed and are listening to local emergency, some local businesses, etc. What are some of the features I need to learn to use that are cool? The owners manual might as well be written in Japanese, so I am learning slow and by myself for the most part so I want to take advantage of the cool features that I would get a lot of use out of right away.

Thanks,
Kevin

Close Call is one you will likely find very useful.

I imagine SAME is another one you will find very useful.

Good decision to go 'all the way' with the XT. It should serve most
areas of the USA for many years to come.

3287. Re: [BCD396XT] unitrunker

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-02 17:58:18 UTC
From: dmccorm@charter.net
Topic: 3283 Message: 3287

The trunked system needs to be programmed into a System. Enable the Control Channel Output (Extended is not needed) in the Settings. Press HOLD on the system, the control channel should be displayed along with the SysID on the radio, run UniTrunker using the BCD396XT radio setting, set the data source to input and signal, set the com port to the correct one, as well as the port attributes (baud rate, Data bits, stop bits, parity), set the radio run to running. The trunked system should start displaying data in UniTrunker automatically.

Here is a helpful tutorial from Utah radio covering the GRE PSR500 series that may help: http://wiki.radioreference.com/index.php/Object_Oriented_Scanner_Software

If you go to

http://info.uniden.com/twiki/bin/view/UnidenMan4/BCD396XT

you'll have the User's Manual. On the first page there's a link to
"Complete Reference". You'll find a number of diagrams of the
various screen modes in there. You can search the Complete Reference
for "Display Mode" and find most of them by just searching for the
next occurence of that term.

3297. Sqelch Level presets changeable?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-03 22:47:15 UTC
From: Bob
Topic: 3297 Message: 3297

Ok I just received my 396 and into my second day of using it. I own the Pro-106 also so you can imagine trying to learn both radios, being how different they really are. I purchaced it mainly for it's encryption mute option which the 106 does not have. But that is a different thread so lets not go there now.
Here is my first, and probably only question for the group (may nead Paul's help on this one!).
I am not very happy with the preset levels that are predetermined for the squelch. I find that the settings are not very well spaced. Let me explain.
Squelch Level "0" and "1" both cause the squelch to remain open no matter what, even if no signal is coming in (no antenna on the radio). Then you have Squelch Level "2", and wow. It is way too tight. When I want to monitor a reletivaly weak station, I have to open up the squelch to hear it, even though it is not that weak, if you know what I mean. Is there a way to set the digital squelch levels to where I want them? I was able to do it with my Kenwood TH-F6 radio and it worked out great. I set location 0 to open, 1 to just barely on the edge of closing the squelch with no antenna, #2 to closed with a barely receivable signal, #3 would squelch out a .3uv signal and so on. Worked out great. There are 15 preset levels on the 396. From #5-15 are pretty much useless.
Anbybody help?
Bob

Make sure you have set the *correct* mode for the channel you want to receive. For example, using AUTO or NFM on an FM station (which most stations still are) will cause poor squelch performance.

As for the 0/1 being open, most squelch knobs operate that way - having some 'room' before the squelch setpoint is reached.

3299. Garmin 18 PC Info

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-04 06:07:56 UTC
From: Frank Cardenas
Topic: 3299 Message: 3299

Hi Everyone, I just purchased a new Garmin 18 PC (serial) to do GPS with my 996T. Just curious if anyone is using this model and what do I need to do to set it up for the scanner? The Garmin comes with a CD do I need to download the software to the GPS ? How do I set it up to work with the 996? I'm using Vista on the laptop will this work? The paperwork says it is compatible with XP but doesn't say anything about Vista. Any help or advise would be greatly appreciated.

Thanks,
Frank

Did you get the one that has external power input such as a cigar lighter?

I just plug it in to the rear port of the 996 or 15, plug in the power connector and press the GPS function on the radio.

The serial port should be set to the rear port at 4800 baud.

If it's connected (or searching for satellites), you should see GPS direction/Time on the radio display.

i've noticed in my xt sometimes the arrow Wilk point up or down for scanning sequence, but is there a way to set it up or down.. I must be hitting a button that is changing it.
Thanks Tony

Twist the scroll knob to change the direction.
For up, twist it clockwise while it is scanning.

Twist the scroll knob to change the direction.
For up, twist it clockwise while it is scanning.

3307. Choppy audio

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-04 17:10:45 UTC
From: n8wrl
Topic: 3307 Message: 3307

Brand new 396XT here and using ProScan I think I have my lcoal P25 standard system programmed. As it scans I hear dispatchers and mobile units conversing. I can understand about 30% of what they're saying - the rest is broken up audio. Signal strength looks good. ATT doesn't seem to matter. Hold time is 2sec.

One of the built-in systems is the 'Palmetto SC 800' for South Carolina. The systems it covers are a ways away but don't seem to have this problem. That makes me think I've programmed my local P25 incorrectly. I got the data from RadioReference and used ProScan to program and 'upload' to the radio.

Any ideas?

Thanks!

-Brian n8wrl

3308. Serial port and GPS usage

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-05 00:54:38 UTC
From: Alex
Topic: 3308 Message: 3308

Hi everyone, I have three questions for the group covering the serial port and GPS usage on the 396XT.

First, when using the GPS feature of the radio, is it possible to globally (and quickly) turn on and off the feature for those times when the GPS is not plugged into the XT? For example, if I'm in the car I'd have the GPS attached to the radio but, when I leave the car to go elsewhere, I want to have the radio go back to scanning without worrying about location. Ideally there would be a one button (or a Function+button) setting that would tell the scanner to ignore the location data that is programmed inside any system.

Second, is there a source for just the small radio-side connector of the cable?

Third, how many wires is the radio using for serial communication? Is it just three (RX,TX,GND) or is it five (RX,TX,RTS,CTS,GND)?

3311. Re: Sqelch Level presets changeable?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-05 13:24:07 UTC
From: foxwoodscasino
Topic: 3297 Message: 3311

Thanks for that great tip Joe. I basically changed the default modulation for some of the bands from NFM to FM. Things sound a lot better and less choppy for the weaker things. I wonder why they have the default at NFM. I know that is the future for everything to go NFM but most are still FM. I still wish there was a way to manually change the preset values of the squelch, but maybe in the next firmware version

I purchaced it mainly for it's encryption mute option which the 106 does not have. But that is a different thread so lets not go there now.
> > Here is my first, and probably only question for the group (may nead Paul's help on this one!).
> > I am not very happy with the preset levels that are predetermined for the squelch. I find that the settings are not very well spaced. Let me explain.
> > Squelch Level "0" and "1" both cause the squelch to remain open no matter what, even if no signal is coming in (no antenna on the radio). Then you have Squelch Level "2", and wow. It is way too tight. When I want to monitor a reletivaly weak station, I have to open up the squelch to hear it, even though it is not that weak, if you know what I mean. Is there a way to set the digital squelch levels to where I want them? I was able to do it with my Kenwood TH-F6 radio and it worked out great. I set location 0 to open, 1 to just barely on the edge of closing the squelch with no antenna, #2 to closed with a barely receivable signal, #3 would squelch out a .3uv signal and so on. Worked out great. There are 15 preset levels on the 396. From #5-15 are pretty much useless.

I think you hit on the reason: They designed it for the future, not the present. I also think they expected everyone to change to NFM much faster than they are.

Actually, I think with the XT you can set the defaults for AUTO mode.

As far as your first question goes, there is not a global on/off for GPS enabling. However, if there is no GPS input, the scanner will basically ignore whether the group or site is GPS enabled. If you power up with no GPS, it will scan everything not locked out or disabled with a quick key. If you are scanning with a GPS connected and the GPS stops sending data (i.e. you drive into a parking garage), everything will remain as it was until new GPS data is received (what's locked out by GPS remains locked out & what's unlocked remains unlocked).

I don't know of a source for the radio connector, but one may exist. The only other device I've see that uses that connector was an alpha-numeric pager (Motorola) I used to carry for work, so it's not common.

Hope that helps

Clayton

What I do is have a 2nd non-GPS profile set up on Startup Key 2 and the GPS profile set up on Startup Key 1. If I am switching to using GPS, I power up while holding down 2 and this locks out all the non-GPS versions of my systems. To switch back to the no-GPS mode, I power up while holding down 1, which locks out all the GPS controlled stuff and unlocks my ¨Static Location" versions of the systems.

Yes the XT does have the Auto mode, so whatever you set the default for for that particular band that the freq lies in, it will use that modulation. So if you set the default modulation for 150-174 to FM, any freq set for auto will revert to FM when you program in a new freq.

Thanks to all who responded I really appreciate your help.
Frank

Hi Everyone, I just purchased a new Garmin 18 PC (serial) to do GPS with my 996T. Just curious if anyone is using this model and what do I need to do to set it up for the scanner? The Garmin comes with a CD do I need to download the software to the GPS ? How do I set it up to work with the 996? I'm using Vista on the laptop will this work? The paperwork says it is compatible with XP but doesn't say anything about Vista. Any help or advise would be greatly appreciated.

Thanks,
Frank

Aaron,

Select your conventional (doesn't work with trunked systems) frequency that you want to monitor for tone outs

in the menu goto tone-out for...
then tone-out setup
then tone-out 1 (if you've never been there before)

in that menu you can set the name, enter your frequency from above, tones (A and/or B) if you know them (leave them on 0 and it will search), delay, alert and AGC

once you have that configured you can go back to the tone-out for... menu and choose tone-out standby and that will start your search.

Tom

Allowing single and double quotes generates a ton of headaches for PC software (most text files use those characters to delineate alpha fields from numeric fields or to indicate that multiple words including spaces comprise a single tag). Not allowing them causes some minor compromises in a very few cases when naming things. In the end, we opted for the minor compromises over major headaches.

That answer was/is way over my head but please try again to explain why it "generates a ton of headaches" to have a simple ' vs a simple * . If it is really that complicated then I guess having a more simple answer won't work. Not being argumentative, just trying to understand more clearly. I have wondered why there wasn't a ' myself.

Certain text characters, like commas, apostrophes and quotation marks, are used to separate fields in database files. It is how a computer knows to separate one field from another, and then one record from another.

Since the text tag is part of the database held within the radio, to allow these text characters would require Uniden's programmers to use non-standard characters for the database structure. This in turn will confuse programmers now and in the future, who expect a standard method of database structure. It is also possible that these characters are hard-coded into the radio firmware.

3331. P25 level

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-07 05:11:02 UTC
From: rons
Topic: 3331 Message: 3331

After exhaustive search here, there, everywhere, including radioreference. I cant find a way to adjust the p25 decoding level in the 396xt as I did in the 396t and 996t.

I see I can look at it in the xt and its set for auto so it must be available? I tried to adjust it with freescan but all it does is always revert back to auto and decode level 8.

I adjusted the other radios to decode level 7 with 'much lower' error rates.

Can it be done?

Re: CC -- makes sense, probably right.

Re: searching -- there's not a place to change the "audio" setting for searching -- Analog Only, Digital Only, or All. Those options are available for channels in memory -- but how about searching? It doesn't look like that's something you can choose in search mode, from what I can tell. Therefore, I can't find a way to display tones in search mode either.

For search mode, the options are:
Edit Name
Edit Srch Limit
Set Delay Time
Set Modulation
Set Attenuator
Set Step
Set C-Ch Only
Set Audio AGC
P25 Waiting Time
Search With scan

There's no "Set Audio Type" like there is for memory channels . . .

Any other clues?

For that matter, this scanner has so much memory, I could probably just put all the channels in my search into a group and do my searching using memory channels! That might be the only option . . .

Hello,

Using FreeScan, you can download from 396 into a file, make any adjustments, then upload to 396XT.

Hello everyone,

I just joined your group, I would like some help with purchasing a new scanner.

1. Is the BCD396XT the latest model I should get?
2. Where should I purchase it; directly from Uniden?
3. What software and any accessories should I get for it.
4. or is it best to purchase it from a local vendor and can you get
it pre programmed? I am in the Los Angeles area and would like
frequencies to have LA and Ventura Counties.

I am all new to all this Trunking stuff and would very much like to get back into this hobby of scanning again. I hope you can help me make the right decision.

Thank you,

You will find a lot of info on this forum that will help you answer these questions. I'll give you some quick feedback.

The BCD396XT is a great scanner, and the latest in the Uniden line. It is well suited for the types of systems in LA and Ventura county.

Where to buy? I purchased mine from scannermaster and recommend them strongly. There are other choices as well.

You should get software to program the scanner. You can also use the software to control and log the scanner. There are 3 basic choices. ProScan, ARC-XT, and FreeScan. You can download all 3 and try them. My choice is ProScan based on UI and functionality. Many opinions on this subject. I also suggest using the RadioReference web site to get programming information for the systems you are interested in. If you get their premium service you can download the systems into any of the 3 software programs I referenced here.

You will also need to connect the scanner to a PC. If your PC has a serial port, a cable is provided with that scanner that will do the job. If you do not have a serial port on your PC you will need a USB adapter. Again multiple choices here. I use the Uniden USB-1 adapter.

Other than a utility that we haven't really released to the wide public, I know of no PC software available that will operate in Clone mode. But, if you have such software, the steps are: Menu --> Wired Clone --> then select MASTER if the scanner info is being transferred out to the PC or SLAVE if scanner info will be transferred in from the PC.

If you mean to use software like FreeScan, ARC, etc, then plug in the cable. By default the scanner is set up to operate at 115200 bps out the serial port.

There is no 'mode' you have to be in to connect to a PC. Just plug in
the cable making sure your PC is set up correctly first.

3347. Uniden Power Supply dead?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-10 18:25:45 UTC
From: sberrynh
Topic: 3347 Message: 3347

Has anyone had issues with the battery charger that comes with the BCD396XT? Mine has never worked and I get no voltage from from it. The model #is S008CU0600080.

I thought it was pretty strange to get a dead PS. It is a switching PS, so I don't know if there is something unique about it that does not allow me to measure the voltage at the connector...???

Nothing happens when I plug it into the scanner. I have been putting alkalines in it since nearly day 1 as a result. With or without batteries with the alkaline/NiMH switch in either position, adapter doesn't power on unit or make any difference to its operation/display.

Anyone seen this? Just want to check before I order another PS.

Thanks.

Steve

Or more precisely, it's how some database software programs import files from other sources, although often the user is given a choice (including but not limited to commas, asterisks, or quotation marks) of what the delimiting character (for separating fields) is. I'd be surprised if any modern database software actually uses any of those characters mentioned to delimit fields for its own database file as that would be way too limiting. I sincerely doubt it would confuse any programmers, although it confuses some users!

My 396XT is missing the beginning of some transmissions and some other times like when a telecommunicator replies
"10-4" (short TX) the scanner will miss it allogether because it has resumes scanning sites already. i dont want to increase my hold/delay time but am wondering... is there a way to lock-out or turn off sites until i travel to where the site is located? (so i am only searching for TX on nearby towers in areas of jurisdictions close to me)

Any help is appreciated
Shane A.

You would want to increase the *DELAY* time, not the HOLD time to let the scanner stay on the channel longer and not miss replies.

> but am wondering... is there a way to lock-out or turn off sites until i travel to where the site is located? (so i am only searching for TX on nearby towers in areas of jurisdictions close to me)

Yes. You can do exactly that - lock out certain Sites, or you can assign them to different System Quick Keys (SQKs) and enable/disable them faster, or you can go the 'high tech' route and get a GPS that will automatically lock and unlock the sites as you travel.

Joe M.

One way is to assign SQKs to the systems in a regional arrangement.

I connect a GPS and have the systems turned on and off automatically based on my location relative to their coverage.

3356. Directly going to a channel?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-13 05:12:23 UTC
From: andy_195
Topic: 3356 Message: 3356

Hello,

I'm a newbie here---just joined the group.

I just got my new BCD396XT, and I'm trying to learn as much as I can about it. The one thing I can't seem to figure out is how do I go directly to a channel that I want to listen to? I found the online manual for the BCD396T, and it has a function key of "rcl"---but the XT does not have this.

The manual that came on CD is set up for a Windows computer, and I have a Mac.

Any help would be greatly appreciated.

Thanks!

Andy

What you want to read up on is System Number Tags and Channel Number Tags.

Once you have those assigned, it's easy. Say you assigned the System you want to go to SNT 33 and the channel CNT 71. Just press "33.71 MENU" and it will take you directly to that channel.

Sorry, Andy. I assumed you knew where the online manual was.
When I said to read up on it, that's where I was talking about.
That, and/or the PDF manual.

I have "numbered" my channels in a very simple way. I know it won't work for everyone but for me it makes it "simple". Instead of trying to remember around 4000 freqs (that what I have so far) in the scanner I have each "system" numbered and in each system I have "number tagged" the first frequency as number 1. In my case I have around 56 systems (for traveling reasons, they are areas I frequent that I have pre-programmed). So if I want to go to system 13 I hit HOLD to stop the scanner then 13.1 MENU to get there quickly. I then scroll to the channel I want. Again it is easier for me to remember (even with a cheat sheet I carry) a few systems rather than thousands of frequencies. Hope that helps even a little. I know how hard it is to learn the XT.

I have my number keys the same as the quick key.
That makes it easy to remember.
Where I have more than 1 system assigned to a quick key I give the other systems a quick key not used.
Say I have 3 systems assigned to quick key 5.

The system I listen to most is number key 5.
The next might be 500 and then 501. (or 501 and 502) Or something like that.

Like Jan, I duplicate my SQKs.

On your scheme, you don't have to number the first channel '1' if it's a Conventional System. Using your example, "13. MENU" will go to the first channel in SNT 13. It will do the same for Trunked Systems, too, but the first channel will be a trunking frequency. The channels are scrolled-to after the trunking frequencies.

Instead of trying to remember around 4000 freqs (that what I have so far) in the scanner I have each "system" numbered and in each system I have "number tagged" the first frequency as number 1. In my case I have around 56 systems (for traveling reasons, they are areas I frequent that I have pre-programmed). So if I want to go to system 13 I hit HOLD to stop the scanner then 13.1 MENU to get there quickly. I then scroll to the channel I want. Again it is easier for me to remember (even with a cheat sheet I carry) a few systems rather than thousands of frequencies. Hope that helps even a little. I know how hard it is to learn the XT.

Joe,
Using your example, if you don't press "Hold" first, you'll activate or deactivate SQK 13

Wouldn't it be SQKs 1 and 3 rather than 13? ".13" would be SQK 13.

Yep. Sorry. Again, way too much info to remeber. And I thought I learned a lot with my old BC-250 50 ch scanner back in the early 80's. Wish it was that simple sometimes.

From: Dewey
Topic: 3371 Message: 3373

Radio systems will use repeaters to increase range. Unlike simplex (radio to radio on the same frequency), or duplex (radio to base on a transmit frequency, but listen on a separate receive frequency) radios, radios operating on a repeater system transmit on a transmit frequency which is received by the repeater, and simultaneously rebroadcast by the repeater on the receive frequency to all of the radios which hear on the receive frequency. The purpose of this is that the repeater is normally of a higher power, and at an optimum (high) location (repeaters can also be linked for an even greater range). This is why some agencies have "direct" frequencies (channels) that only operate for a mile or a few, but can switch to the repeater channel, and can be heard countywide. A person operating a radio on a repeater system can transmit on a repeated frequency standing next to someone else with a radio on the same system, and will NOT be heard on any of the system's radios if the transmitting radio can't make the repeater.

My opinion of the Uniden's repeater reverse is that it will enable the listener to quickly swap the transmit for the receive frequency should they happen upon a one sided conversation which may really be the transmit side of the radio that is being heard. The repeater reverse is more beneficial for convention radio systems over trunked radio systems because switching from the transmit or receive frequency of a trunked system is really not helpful without the benefit of the control channel. Finally, there are formulas for "normal" repeater operations... in the 450's through 470's, mobiles transmit 5 MHz higher than they receive, and in the 490's, mobiles operate 3 MHz higher than they receive. If the frequency that you are monitoring is part of a repeater system, but the system does not follow the "normal" formula, you will not be switched to the proper frequency.

In the 800's the repeater offsets are 45 Mhz, and I think 15 MHz is in there somewhere.

Dewey

It's a way to monitor the frequency the mobiles/portables/control stations are transmitting on for a repeater. It's one of those functions that most people would never use, but some like to see if a unit is close to their area, and on a repeater checking the input (reverse) is the only way to do that.

I don't think it works with trunked systems, but it technically could.

3377. Want to buy a BCD396T or XT

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-15 19:00:57 UTC
From: Patrick
Topic: 3377 Message: 3377

I am in the Dallas / Fort Worth area and last week decided to get a 396T or XT, haven't decided yet exactly which one. If I have to spend cash I will buy a new XT, if I can find someone who wants to swap equipment, I will settle for a T.

What I have is

Motorola MTS2000 800Mhz Model 3, with the firmware upgrade for rebanding. Model 3 is full keypad and display.

Motorola MTS2000 UHF model 2, 403-470Mhz Model 2 is limited keypad and display.

Motorola MTS2000 UHF model 1 hack 403-470Mhz top display

Motorola MTS2000 800Mhz model 1 hack top display

Motorola XTS3000 UHF 403-470 analog/digital, conventional and trunking

Motorola MCS2000 800Mhz Model 2, with the firmware upgrade for rebanding, unit was set up for remote mount but while it was at Motorola I sold the cable and head. The head and / or remote kit are the cheapest parts to buy compared to the unit its self. LOL

I also have a couple of older scanners but I wont waste your time with those, unless your in an area that isn't affected by re-banding.

I no longer work for a 2-way shop and am consolidating all my listening to just a few high end commercial units and one or two really good scanners.

If your interested in any of the units above, let me know, I can give you more detailed info as to what each can do, and what accessories I can toss in to make them a better deal, and will definitely work with you on programming.

Thanks..

Ditto here. The power button is 'recessed' a little compared to the
other buttons, but it has the same sound/feel when you press it.

From: spacezephyr
Topic: 3386 Message: 3386

Hi All,

Q: Trying to understand how to use the Band Scope mode. Looked at the Uniden twiki...???

Q: How do I enter Search mode (?), then tap Function + 3 (SR3)??

What steps are needed to active the Band Scope Mode?

Any comments most welcome.

Thank you.

Greg

http://info.uniden.com/twiki/bin/view/UnidenMan4/BCT15XBandScopeMode

The 2nd heading on that page. If you haven't changed any defaults, then HOLD, F+3(sr3) will turn on the band scope.

3388. Battery Charging Set Time

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-18 03:00:18 UTC
From: sallen101_10
Topic: 3388 Message: 3388

What exactly does the "charging time" mean?, Does it mean that if i set my scanner to a certain time period (6 hrs.) that it will make sure that the batteries are fully charged in 6 hrs or just that it will continue charging the batteries for 6 hrs then discontinue charging but remain able to power the scanner after that(not necessarily charging the batteries to their full capacity) ?

3389. Re: [BCD396XT] Battery Charging Set Time

Topic: 3388 Message: 3389

The scanner has no way to determine the status of the cells. That's why
I and many others recommend getting a charger that is designed to charge
NiMH cells. Anyway, the "6 hours" means it will charge for 6 hours then
stop.

Both should last very close to the same.

As for whether a 2700 mAH cells is good depends on the brand. That's a pretty good value if the cell meets that spec - especially if it's a low self discharge cell.

3392. ProScan 4.0 Is here

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-18 12:54:41 UTC
From: bob_proscan
Topic: 3392 Message: 3392

The biggest improvement besides the BCD996XT / BCT15X support is the increased speed of starting ProScan loading the logging and recordings data. 15 times faster loading.

ProScan features includes:
Programmer and Database - Imports from the RadioReference Web Service (Online and CD).
Extensive History logging
Remote Control Scanner Over IP
Web Server - Listeners using a web browser can listen directly to your ProScan server
ScanCast - Streams audio to RadioReference / Icecast / ShoutCast servers
Full featured Audio Recorder
Band Scope (Spectrum Analyzer)
Control Channel Data Monitoring for the XT Scanner Series
Session Manager for managing many instances of ProScan on the same computer
ProScan supports the BCD996XT, BCD396XT, BCT15X, BC346T, BCD996T, BCD396T, BCT15, BR330T, BC796D, BC785D, BC780XLT, BC296D, and the BC250D Scanners.

Version 4.0.0
Added - BCD996XT and BCT15X support
Added - RadioReference - Band Plans added at the site level
Added - RadioReference - Locations added at the site level
Added - Logging grids (History, Frequency / TGID, and Recordings) adjustable column width saves to the configuration file
Added - Database (DMA type) - Sort button second click sorts in descending order
Changed - Logging grids data - Fast loading during program start
Fixed - RadioReference - P25 systems imported wrong system type if the rebanding flag is detected
Fixed - Sound devices disabling and enabling can cause wrong sound device selected in ProScan

3394. antenna question

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-19 02:06:04 UTC
From: jeffm1977@comcast.net
Topic: 2671 Message: 3394

hey all on the group,

is anyone on the group familiar with the Austin ferret base antenna? is it worth the money they want for it? does it really work like all the reviews on e-ham.net claim?

thanks,

jeff

I would not recommend it. I have one and about the only band it picks up decently on is VHF HI. I have a VHF Ringo Ranger mounted at the same height and it beats the Ferret on everthing, including VHF-LO, and 800.

Mike

From: havmedic26
Topic: 3396 Message: 3396

why can't the scanner display UID's with conventional channels? It can't be that difficult, right? I carry mostly motorola XTS-2500s and they display every type id for every channel (kenwwod, motorola, conventional, trunking, etc). we use mostly conventional channels around here, so It would be nice to alpha tag each radio. then could we set the scanner to recieve Emergency Alerts?

I have been using the 996t for a long time and i love it. I wanted to try some of the new features of the 396xt and i love it. i am going to get a 996xt after christmas. my question is this. can I use the scanner to find the input freq for repeaters. obviously not UHF as those are easy, but VHF, and in particular VHF P25. I have parked my truck next to the cruisers, and keyed the radio. Most often the close call comes up with the output of the repeater. I am not sure why it does that or how, since we are not that close to the repeater site (but still in town)

There is no provision to program UIDs in Conventional Systems.

As for why the scanner can't display the UID number, I'm not sure.

Did you try programming the channels as a single-frequency Trunk System?

Subject: [BCD396XT] update a freq with found nac code

is there a way (or could there be a way in the future) to update a programed channel with a found nac code or pl/dpl when it is set to search?

There was a discussion on this subject a short while back on some list
(don't remember which one), and Joe is correct.
Program the frequency as a "Single Frequency Trunk System" and it works.
I played with it for a while and as I stated, it works.

Yes, hit the E button. "I think" right after that is asks if you wish to keep that pl/nac/dpl code. You hit E again if the answer is yes.

Very few analog radios send out UIDs. Those that do use a variety of formats.

3414. Re: why can't the scanner display UID's with conventional channels

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-20 04:43:30 UTC
From: havmedic26
Topic: 3396 Message: 3414

That mabey some what true (I dont remember the ht1000 / mt2000 series sending them), but many radios on analog systems do send them. Around here, we have all gotten grant money to upgrade our radios. Almost every (by which I mean every) fire dept was given xts5000, and most police depts were given xts2500 (or something very very similar). These are all digital radios in the same way that the bcd396xt is a digital scanner - it is capable of doing digital. Off the top of my head (i supposed i could look to be sure) I think I remember setting some digital signaling option for the unit IDS.

Kenwood on the other hand, definitely uses analog unit ids. I dont like the system as much (radios dont always pick up the id of the second person to transmit, and I think they are only available as post-transmission IDS which is not very useful in my mind. Motorola is optional pre or post.)

anyway, I meant this mostly as a suggestion to Upman. I know it can be done via firmware. Some motorola radios that did not originally have the unit id display were upgraded to display them through firmware. Anyway - my 2 cents.

and if you are reading this Upman, the "useless manual" is absolutely terrible. The worst I have ever seen. I realize this has been said. Look at it this way - with previous scanners a map of the menu structure was useful or perhaps absolutely required. The user manual is a lot like that. there are 20 or whatever headings to chose from, then you have to try to guess your way around from there.

JT

From: Rich Carlson
Topic: 3396 Message: 3415

Many conventional systems use a form of ID called MDC-1200, probably the most common ID format used on non-trunked radio systems. While there are no scanners that decode MDC ID's, you can use a software package available (I think it is called WinMDC) or one of several third party decoders. I have a Cimarron C+II that works very well, in fact it is what is used in many dispatch centers. Some models of the Cimarrons even allow you to alpha tag ID's. There are other models for different formats like GE-Star (or whatever it is called these days).

I wouldn't be surprised if someday scanners can decode MDC, it wasn't all that long ago that PL and DPL capable scanners were introduced, now that is pretty much standard fare. That said, I don't know of any consumer grade radios planned for this.

The reason you see this feature on trunked scanners is that the firmware is already decoding the control channel data to track the system and identify talkgroups. It was only a little more work to decode the ID's as well.

Off the top of my head (i supposed i could look to be sure) I think I remember setting some digital signaling option for the unit IDS.

Yes, they have an option for that (most likely MDC-1200). Still, I stand by my statement that most analog radios (or digital radios in analog format) do not send Unit IDs.

> Kenwood on the other hand, definitely uses analog unit ids. I dont like the system as much (radios dont always pick up the id of the second person to transmit, and I think they are only available as post-transmission IDS which is not very useful in my mind. Motorola is optional pre or post.)

Pre or post is a good debate for another time - each has merits and issues. BTW, most Motorolas will do pre, post, or both.

As far as the Kenwoods, it is optional in some models the same as with Motorola radios. And like Motorola there are a variety of formats: MDC-1200, DTMF, 5/6 tone, GESTAR, or even MDC-600 or MODAT and a couple dozen other formats. It is not practical for any scanner to emply evert ID format for analog signaling. MDC-1200 might currently be the most popular, but that would not cover everything and on the whole it's still only used on a small percentage of radios nationwide (even if it is popular in some areas).

> anyway, I meant this mostly as a suggestion to Upman. I know it can be done via firmware. Some motorola radios that did not originally have the unit id display were upgraded to display them through firmware. Anyway - my 2 cents.

I know others have mentioned it to him, and maybe if enough people request a particular format (you would have to know which one is used), then it might make it into a scanner.

But, it's not like P25 where there is a single standard format for UIDs.

> and if you are reading this Upman, the "useless manual" is absolutely terrible. The worst I have ever seen. I realize this has been said. Look at it this way - with previous scanners a map of the menu structure was useful or perhaps absolutely required. The user manual is a lot like that. there are 20 or whatever headings to chose from, then you have

to try to guess your way around from there.

Sounds like it just needs a glossary so you can learn the terms.

Hate to be a smart donkey, but...

If you entered .0 and it added 5 more 0s, that would be six.

Regardless, if it's showing . and any number of 0s, it should work.

Regarding the Unit ID's.

Programming the 396XT/996XT for Unit ID's to work...

1.) How many "Sites" can be in a System on the 396XT/996XT for the
Single-Frequency P25 System ?

2.) It only allows 1 P25 Freq per Site ? So If there is 50 P25 Conv freqs.
It be 50 Sites to make the Unit ID's work.

(Note: I'm not talking about a MOT or P25 Trunked 9600 trunked system!)

It doesn't say on this wiki page. or point me to where it says the limit.

Per "The Complete Reference" up to 256 sites per system (max limit of 1000 sites total in the scanner).

Brian, in the first link you provided, the Uniden twiki, the answer states "Each single-frequency P25 system must contain exactly 1 site." under the heading of "Create Exactly 1 Site". If you can only program one frequency for a single-frequency P25 system, then each system can have only one site. You are going to have to setup a system for each frequency. 50 systems to monitor 50 frequencies. I have not tried a single-freq P25 system yet. I assume it would be easier to have the ID Search set rather than ID Scan.

Thanks.

It seems like multiple "Sites" in a "System" is working fine.
(Only owned this 396XT scanner for 24hours so far. I was pre programming
before I got the scanner. :-)

Like Post #40
http://forums.radioreference.com/uniden-scanners/164055-unit-ids-radio-id-xt-unidens-here-2.html#post1194012

I just wish there was a option to stop the ENC muting(So I can hear the
encryption sound). So I could easily copy those UnitID's. Maybe the next
firmware have that option. It would make it better then GRE digital
scanners :-)
When users are searching the bands for P25 freqs/NACs.

Date: 2009-12-24 01:39:42 UTC
From: Sandy
Topic: 3425 Message: 3425

I was pressing the Function Button and scrolling around and now all of a sudden I can't get rid of the Scanning of Public Safety and Custom 10 and it's driving me crazy!!! How do I delete these or keep them from scanning with my usual St. Louis County, MO frequencies??? HELP!
Thanks, Sandy in St. Louis...

3426. trade? GRE500

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-24 05:02:02 UTC
From: Glenn Valenta (K0BO)
Topic: 3426 Message: 3426

I miss my BCD396! I want it back but I used the money I got when I sold it to buy the GRE500 believing I would like it better.

So, I'm looking to see if someone either wishes to swap. I've had the GRE for less then a year and there is nothing wrong with this radio but my taste for operations and the menu structure is allot different then GRE's concept, totally a personal preference. I'm hoping to find someone who has a BCD396XT who feels the same way about their BCD396XT purchase and would be interested in a swap.

Please respond off list if interested.

73! Glenn K0BO

Thank you...I finally got it to stop scanning all those Functions but it took me a while. I would like to look at some of those functions but I don't want the scanner to start scanning them again on it's own. Then it's scanning them along with my other frequencies like last night and it's a pain trying to get it to stop that. I fooled with it for hours, sheesh!
My other question is what exactly is Close Call and do most people have that scanning with their other local frequencies?
Thanks for your help!
Happy Christmas Eve!
Sandy

From: Richard A. Victor
Topic: 3425 Message: 3429

With all due respect, it is extremely unlikely
that the scanner started scanning those services
and custom searches on its own. Much more likely
is that you inadvertently turned them on when you
were trying to do something else. As you become
more familiar with the scanner, you will be less
likely to do that. Now that you know how to turn
them off, it shouldn't be a big deal if it were to happen again.

Close Call is a feature which permits the scanner
to find and display information about a signal
which is significantly stronger than other
signals so that you can identify it. It is
useful to find frequencies in use by radios in
your immediate vicinity. I can't speak for
others, but I use it only when I have a specific
frequency that I'm trying to find. Others may
use it all the time just to see what pops
up. Keep in mind that if you use it in
conjunction with your normal scanning, it will
interrupt the channel being received every few
seconds to check for Close Call signals unless
you have it operating in the DND (Do Not Disturb) mode.

Best of holiday greetings.

Dick

From where are you getting the numbers? Are you sure you didn't enter an "o" in place of a "0" or and "i" in place of a "1?"

I think that's the serial #. The ESN is similar but a few digits different plus you have to get the SUM # from the firmware page where the ESN is.

That's a Serial Number, not an Electronic Serial Number.
While they are close, they are different.

You can always get PRO96COM and use the
control channel data output to get the UIDs.

MCH,
umm I tried to use the Pro96com already with 396XT. It didn't log anything.
plus the "Single Frequency P25 Trunked Systems". I try again with the
Pro96com If you say it should work.
It doesn't have a control channel like a P25 9600 trunked system has. ;-)
It works great on those type of systems :)

kayi4cle,
I already have a PSR-500!

True, PRO96COM only works with P25 Trunk Systems. But, I believe the XT
will show you the UIDs on encrypted P25 conventional channels. I have
some that are nearly full-time encrypted that all use the UID of 00001.

I found that when you have an encrypted xmission on a conventional P25 channel, the ID only shows up for a split second because the 396XT mutes the audio, so you have to keep trying to catch it by hitting hold at the right split second when the ID shows up. Otherwise, the ID always shows the same number like Joe said, 00001 or something similar. But that isn't the real ID. Watch the display closely during the ENC transmission and you will see the real ID pop up on occasion. Once you hold it on the ID successfully, it will now keep on showing the ID's automatically until you press scan or hold again to start it searching again.

Because we started talking about other stuff ;)
1.) To see if Pro96com software work on this type of setup. (It doesn't so far).
2.) Talking about the UID:1 Mch was seeing.

It's somewhat on topic :)

Could someone enliten me with a manual off 273 pages, there are no instructions on how to set the Priority ID scan on the XT. The closest it comes is page 144, but no step by step instruction.

Hello all,

Just bought myself a New BCD396XT scanner and so far love it! Just wondering if anyone charges the battery's in the radio? Looking in the menu system on the radio is has a option of charge time, what does this mean? If I set it to 10 hours the radio stops charging after 10 hours? I also assume that the charge rate is fixed and will only charge at a certain rate for a fixed length of time? Just wondering on this. I normally use a LaCrosse charger to charge up my NIMH batts with. Just wondering on this. Also the proper charge rate for NIMH batts is 0.5c to 1c is that correct.

Thanks,

Joey

You're far better off getting a dedicated NiMH charger.

> Looking in the menu
> system on the radio is has a option of charge time, what does this mean? If
> I set it to 10 hours the radio stops charging after 10 hours?

Exactly

> I also assume
> that the charge rate is fixed and will only charge at a certain rate for a

Correct.

> I normally use a LaCrosse
> charger to charge up my NIMH batts with.

Good choice from what I've seen reported about it.

> Also the
> proper charge rate for NIMH batts is 0.5c to 1c is that correct.

Not sure about this one offhand. I tend to charge at .25c to .5c.

3449. Can LNK and DAT transmissions be skipped?

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-28 15:56:25 UTC
From: kb9geg
Topic: 3449 Message: 3449

I have the Illinois StarCom system setup and have noticed from time-to-time I am receiving LNK and DAT messages. Is there a way to tell the 396xt to skip these types of messages and continue on looking for P25 transmissions? The LNK and DAT traffic are for groups that have regular P25 traffic. It seems to skip some of the voice traffic while it is stopped for these transmissions.

Technically, not a birdie (internally generated signal). But, nevertheless, PCs are notoriously RF noisy, as are routers and many other computer peripherals. If it is a mixing product, you can try IFX which will shift the intermediate frequency and might eliminate the signal from the frequency. More likely it is direct reception of a signal generated by your computer. In that case, you can try attenuation on the channel. If that doesn't work, isolation is about all that is left. Keep the PC and scanner apart.

In addition to what Paul said...

A few things come to mind.

1. Isolate the source. I friend's monitor drives my scanners crazy, but none of the 4 I have in the office do. Try shutting off the monitor to see if that is perhaps the source (and if it is, replace it).

2. If it's coming from the PC, get one that is less noisy. I have 6 PCs running (and more in other rooms) and have few noise problems. I have had some PCs that were terrible with RF emissions.

3. Try an external antenna. Basically what this does it that it gets the antenna away from the noise source. I would prefer to solve the problem rather than the symptom, but if replacement of the noise source is not an option, this may work. Get the antenna as far away from the source as possible.

One more thing to try: Use the PL or DPL tone squelch. You can search for the tone/code if you don't know it, then hit "E" when it receives the correct one and it will store it. If the user/freq is reasonably strong, it may overcome the local interference and at least not hang on the freq. Most conventional freqs now are transmitting a PL or DPL, but there are still a few that aren't. Just something else to try.

I like the idea of using the PL DPL tones to help eliminate the birdie on the XT. I have even tried it on 155.250(210.7) here in my area. However it doesn't eliminate the birde, it kind of covers it. With the PL programmed for that freq what I get is, what sounds like, two or more people transmitting at the same time on the repeater and it becomes pretty much unreadable.

My question here is, if I do the IF switch does it reset for the whole scanner or just the one frequency I am trying to fix? It would kinda suck to fix one birdie but get another on another frequency that is already working OK.

I would imagine that's because the interfering signal remains and
once the PL opens the squelch you still have the interference and the
desired signal together on that frequency. The PL would just keep it
from annoying you when there's no legitimate signal with the correct
PL on that frequency.

>My question here is, if I do the IF switch does it reset for the
>whole scanner or just the one frequency I am trying to fix?

You can do it one channel at a time. See page 18 of the complete reference.

Is your monitor a CRT or a LCD (flat-screen)?

The old CRT monitors used to drive me crazy with RF but after upgrading to LCDs I can have multiple monitors with scanners sitting right beside them and no interference what so ever.

You can usually get around the CPU generated RF by moving it under your desk and away from the receivers, in other words, increase the vertical separation (same as the antennae in your mast).

All of mine are now flatscreen, but neither the current ones nor the old ones had noise. My friend's is a flatscreen that produces a ton of noise when you're within 10 feet of it.

If you get interference and it goes away or weaken when you remove the scanner antenna, then it is likely from outside sources. It seems to be a common situation for frequencies at the 1/4 th MHz. (151.250, 155.250 etc.) to originate from cable TV installations, often a poorly grounded amp or connection.

My agency also uses 155.250 and when I hear noise on it I try to locate the specific area and call Comcast, they usually get it fixed pretty quickly.

If you are getting it in your home, then try to find where the drop come into the house for cable TV and disconnect it, then see if the interference goes away, if so then the issue is likely inside.

I would like to clarify something about this post. My OLD 396 and the new 396XT both have that terrible whine going all the time. In the car, out of the car, middle of a parking lot....everywhere. It is not an indoor Comcast issue or a matter of taking the antenna off. It is an overpowering signal that obviously does not affect the police radios but wreaks havoc on the scanner itself. I posted something about this a LONG time ago in another forum and no one commented or replied because it wasn't their issue. There definitely is some interferring source whether it is internal to the 396 and XT or in the Bolingbrook area. Lockport, Woodridge, Romeoville, Crest Hill, Joliet, Plainfield, and Naperville with 155.250 all render that same bizarre constant whiley tone. It becomes slightly better but still intolerable when Bolingbrook units communicate. This isn't an indoor/inside the car issue. I gave up on Bolingbrook listening a long time agio due to it. It doesn't happen on the Pro 106, Uniden 250, Pro 92, or Uniden 330. Something about that 396 and XT model brings it out. If anyone disputes that, take your 396 and/or XT to Bolingbrook and see for yourself.

By the way, Happy New Year Rich! Be safe out there and thanks for everything you have contributed to the scanner/radio community.

I echo your statement word for word. Just remove all the cities you mentioned and replace them with Kirkwood, MO PD. I will add that at times the only way I can get what I consider a good signal on this freq is if I am in or very near the city of Kirkwood. Sometimes, but not always it can be enjoyable listening to them.

I also wish everyone a happy and safe new year.

Rich, I haven't heard it in the 1/4 th MHz, but I have major interference here in St. Louis, mobile, at the intersection of I-64 and I-270. The problem here is, I'm almost sure, due to the fact that that our MO Dept. of Transportation has an active facility as well as two large hospitals all residing on either side of the interchange - one of the hospitals being a level one trauma center. When going through the interchange one of the frequencies for the Muni covering this area will always lock up in a "high whine" (typical birdie type signal). But the frequencies involved are 158.790 173.8 PL, 154.650 156.7 PL and 154.115 no PL. Once a mile or so past the interchange, then the muni returns to normal. Since I regularly monitor them I know that this doesn't happen on their equipment, in fact I'm hearing them right now, on all their frequencies. So why would I experience this interference (on both of my 396XTs) and they wouldn't? I've also tried using the radios with the handheld antenna instead of the Larson installed on the car - same results.

Shelley

The 1/4th mHz. interference is common with cable TV, there are
numerous other sources of interference all over the place. Mixing two
signals together to result in interference on a third frequency is
called Intermod, it is possible that two or more cable TV leaks or
other types of noise on different freqs could result in intermod on
other frequencies.

Another issue is image rejection. While newer scanners are much better
at image rejection than older models, they usually are not better than
the actual radios used on the systems. The radios are built for a
specific band segment while the scanners have to cover a wide variety
of freqs, therefore system radios usually are much tighter with
respect to image rejection.

I think I would try two facilities on the XT to see if it improves the situation . One being to switch in Front end Attenuation (assuming you can tolerate the drop in Fundamental signal level) and other being to switch XT to alternative IF. These two tests could give some further clue to nature of interference problem.

Regards BL

Readability. If it switched faster it would be more difficult to read
either the TGID/name or the UID/name. If it's not switching faster than
about 1 second, then it's slow picking up the UID.

The UID on the third line is the only way I can reliably read the
TGID/name. With it switching, I'm always looking at the wrong time, and
taking your eyes off the road for too long is not a good idea. Glances
are the only safe way to go.

From: Paul Opitz
Topic: 3468 Message: 3473

Also, on a Motorola system the UID is only sent on the control channel on the initial channel grant. So, if you enter a conversation late, you'll miss the UID entirely. Also, if the scanner doesn't have a chance to go back to the control channel between transmissions (i.e. if the person responds without a carrier drop), the scanner won't catch the 2nd party's UID. That will account for some missed UIDs, especially if you are scanning multiple systems.

I found mounting the scanner in the right place helps too, I have it so I
can still see the road when looking at it.
Oh, and a really cheap mount that works is a microphone mount, fits perfect
and it's secure.

Thanks Paul, I thought about that but wasn't sure. Thought maybe because the one system in question is a splinter system too...

Also, on a Motorola system the UID is only sent on the control channel on the initial channel grant. So, if you enter a conversation late, you'll miss the UID entirely. Also, if the scanner doesn't have a chance to go back to the control channel between transmissions (i.e. if the person responds without a carrier drop), the scanner won't catch the 2nd party's UID. That will account for some missed UIDs, especially if you are scanning multiple systems.

True, makes sense sometimes it won't even switch over.. Maybe cause its trying to pick the uid and then switch between tgid name... Thanks

Readability. If it switched faster it would be more difficult to read
either the TGID/name or the UID/name. If it's not switching faster than
about 1 second, then it's slow picking up the UID.

The UID on the third line is the only way I can reliably read the
TGID/name. With it switching, I'm always looking at the wrong time, and
taking your eyes off the road for too long is not a good idea. Glances
are the only safe way to go.

Even mounted in front of your nose, when you're focused on the scanner, you're not focused on the road. That's why the info has to be there when you're looking at the scanner.

But, certainly a good mounting location is better than a bad one. I have mine so it's right below the dashboard with the antenna above it for optimum reception in the vehicle. I use a mic hang-up clip which works great for holding the scanner.

It is a common item in recent Uniden scanners, but the IFX should get
rid of it completely.

I used to use display mode 2 but since the firmware updates with the uids I've been using display mode 3.

3481. BCD396XT Batteries

Yahoo group: BCD396XT (2008 — 2010)
Date: 2009-12-31 22:21:01 UTC
From: John
Topic: 3481 Message: 3481

Hi there, i was looking around and couldn't find any info on this.

The batteries that Uniden includes for the 396XT are 2300mAh. Is there any problem at all with my using a more powerful battery with the scanner? I have a lot of Powerex 2700mAh i'd like to use.

I'd match battery strengths in a given set of 3, otherwise i'd put the set of factory included batteries into my rotation and possible phase them out if the 2700s outperform them substantially.

thanks in advance.

They will work fine. As usual, my caveat that NiMH cells should only be charged in a charger designed for NiMH cells (IOW not in the scanner).

Joe, have you considered a remote head?? - I have mine (securely) mounted on center of the dash, all the way in the front, almost against the windshield. That way, as I drive, I barely need to take my eyes off the road to glance at it to see the TGID/name or the UID/name or anything else which I'm interested in seeing. It's not only a lot nicer, it's also a whole lot safer! *smile*

Shell

P.S. Happy New Year everyone!

I have one and like it very much (except for the lack of multi-color).

Yes, it is more safe from the aspect that it's easier to read since the
display is larger.

Thanks Rich. Brain fade here! I suppose, since I haven't experienced any intermod on either my previous 396Ts or current 396XTs, I didn't even think about it - DUH on my part! I've gotten very spoiled by our radios. *grin*

> > Rich, I haven't heard it in the 1/4 th MHz, but I have major interference here in St. Louis, mobile, at the intersection of I-64 and I-270. The problem here is, I'm almost sure, due to the fact that that our MO Dept. of Transportation has an active facility as well as two large hospitals all residing on either side of the interchange - one of the hospitals being a level one trauma center. When going through the interchange one of the frequencies for the Muni covering this area will always lock up in a "high whine" (typical birdie type signal). But the frequencies involved are 158.790 173.8 PL, 154.650 156.7 PL and 154.115 no PL. Once a mile or so past the interchange, then the muni returns to normal. Since I regularly monitor them I know that this doesn't happen on their equipment, in fact I'm hearing them right now, on all their frequencies. So why would I experience this interference (on both of my 396XTs) and they wouldn't? I've also tried using the radios with the handheld antenna instead of the Larson installed on the car - same results.

3488. RE: [BCD396XT] USB to Serial Adapter to use with Programming software

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-01-01 15:31:18 UTC
From: J Harrell
Topic: 3450 Message: 3488

I have a question I just got a Uniden BCD396XT and would like to use it with my Laptop that has Windows Vista on it. However my laptop does not have a serial port on it and has plenty of USB ports however. Would anyone know where I might be able to get one that will work with Windows Vista cheap? I have been looking at the ones on ebay and they seem to look ok and some come with Vista drivers. I don't really want to spend over $15 on it as I may only use it once in a while on the go with my scanner and laptop. Any suggestions or place to buy one of these and stay within budget?

Thanks,
Joey

You should be able to find a USB to RS232
adapter on eBay for around $5 shipped.

Otherwise pick one up at Best Buy. It will work with Vista and Windows 7
also.

Joey;

I am using a Keyspan USA-19HS, with an HP netbook running Vista, ARC-XTpro, and my 396XT.

That configuration works properly.

I think I paid about $15 on eBay for the Keyspan module.

Even if it is a few dollars more, you might want to spend a couple of extra dollars to get a module from a 'real' manufacturer, so that you continue to have driver support available in the future. You may find yourself switching to Win7 soon...or a new computer...or you may find other uses for the USB-serial capability. I've used this particular module for a while across several platforms (Win, Mac, Linux) for various things.

I would bite the bullet and spend the $20 or so for the USB-1 cable
from ScannerMaster. It will work in XP, Vista and W7 just fine, you
can download the drivers for each from the ScannerMaster site.

You can use other USB-serial devices but this one is known to work
just great with all the current Uniden scanners.

If you want to leave the radio in the Fire Tone Out mode, you can put your local fire department reed tone in on of the memory locations and when the tone is heard on your departments frequency, the squelch will open and let you hear the announcement.

The XT radios will also search for the A and B reed tones so you do not need additional software and sound card to discover what your department uses, if the information is not readily available.

Reed tone is a legacy term harkening back to when an audio tone was used to vibrate a reed in the pager that was tuned to that specific frequency. While there might still be many of these in use (since many were made) I believe most modern pager receivers use electronic tone decoders.

When a tone goes out, you typically hear two tones followed by the page announcement. Those two tones are the "reed tones" and you must program these into the scanner in order for the scanner to detect and also be triggered by the tones.

FTO only works on conventional frequencies and is an exclusive standby mode...ie you can't FTO and scan at the same time.

3498. RE: [BCD396XT] Fire tone out search

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-01-02 01:07:27 UTC
From: Patrick - Used 2-Way
Topic: 3494 Message: 3498

He is refering to the 2 Tone Sequential that older conventional channels use. Before the tones were synthesized a pager needed tone reeds.
Then as technology caught up you simply programmed in the specific frequency into slot A and slot B.
Any time you hear a fire dept using the 2 long tones, they opened up the speakers at that specific station. Each tone is a set frequency, and when the A and B tone matched, an alert would sound.
Some depts also use a third long tone, or C tone for All Call.

Hopefully this helps a little.

Thanks Dave, so two questions then. 1 what is a reed tone in term. 2 put the radio in tone out mode. The reason I ask is most of the systems I listen to are trunked with the exception of multiple conv. Channels I listen to. Will it work with all

Subject: Re: [BCD396XT] Fire tone out search

If you want to leave the radio in the Fire Tone Out mode, you can put your local fire department reed tone in on of the memory locations and when the tone is heard on your departments frequency, the squelch will open and let you hear the announcement.

The XT radios will also search for the A and B reed tones so you do not need additional software and sound card to discover what your department uses, if the information is not readily available.

See the Twiki for more infomation:
http://info. uniden.com/ twiki/bin/ view/UnidenMan4/ ToneOutMode

Read all of the information that Paul has provided. Then enter your search frequencies and "0" in both tone boxes. The radio will show the tones received. However, they may not be exact. Merely compare the tones that the radio lists to the closest tone on the charts listed below and enter the known tone. Label as needed.

Motorola Quick Call 2 protocol:

<http://www.genave.com/mot_quick_call_2.htm>

<http://www.qsl.net/k3fss/tones.html>

In addition to Paul's information, if you please.

3507. UID Display suggestion

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-01-03 23:38:41 UTC
From: Ron Cluster
Topic: 3507 Message: 3507

(I posted this on the 996XT group by mistake. Should have gone here, although it can apply to both.)

I know this has been discussed a little recently, but I would like to suggest an enhancement for Uniden to consider regarding the choices of screen display modes.

I would like to have the option of screen display mode be selectable by system.

For conventional systems I use Mode 2 which displays the frequency on the 3rd line. For trunked systems the frequency is not as important to me so I would use Mode 3 which puts the UID on the 3rd line. I'm not a big fan of the alternating text display, although it's better than nothing.

I would like the following choices under each system:
Default
Mode 1
Mode 2
Mode 3

Each system would use "Default" unless one of the Modes were selected for that system.

The Default screen display mode would still be selected the same way it is now.

I am. And that is what I would like to use for trunked systems. On conventional systems however, I like Mode 2 which displays the frequency on the third line. Hence the request to be able to choose the Mode for each system.

And yes, leaving the Mode set to "Default" on a system should let that system change with the Mode selected for the radio, just as it does now.

Hello All;

I would like to thank you all for the outstanding advice,
information, and assistance that has been provided here.

I've taken Glenn up on his offer, and gone over to the 'dark side';
yup, I traded him my XT for his GRE.

I couldn't be happier. While there are a few nifty features I may
(or may not) miss from the XT, the user interface on the GRE is so
much easier for me to use, and the digital audio decoding so much
clearer on the system I monitor, that I am again enjoying scanning.
Which I had not been with the XT. And there are some nifty features
on the GRE that the XT lacks...

Horses for courses, as they say.

So I'm back to having but one remaining Uniden product, my BC-101
(original owner, from new, yeah, I've been doing this a long time)...

73 y'all!

Tom Frank, KA2CDK

Happy NewYears Folks!

I've purchased a BCD396XT after having owned, then sold my trusty BCD396T. Unfortunately, the UASD software that contains all my 396T groups will not work with the new XT version.

Where can I get an update for the UASD software?

Even though I've entered in the radio into my Uniden account, the downloads area does not show the software package. And, the UASD seems to have been removed for the 396T as well from what it appears.

Thank you folks in advance!

Glenn

UASD is not yet available for the XT series. You can use FreeScan and
import your UASD systems then program your XT scanner. There are also
other programs that can import UASD files.

It went the way of the printed manual, not available, does not exist and probably never will. Just like the 396t, it was going to be upgraded thru firmware for a long time, now discontinued, oh well.

I hear you, Mel! But sitting back and thinking about the UASD program that Uniden provided for us with the original dynamic memory radio, they went above and beyond, supplying a buyer with a program to use to help program their radio. Yes, the technology was new and for many a difficult concept to understand. So Uniden, at no cost, gave us a program to both help us program our radio and, by doing so, enabled some of us to understand our radios better.

But, over the years there have been several other people who have developed software, both free and at a cost, which no question was expected! Many/most of them, as already noted, import the UASD files and convert them to their format.

Uniden is not in the software business and I have no doubt, never really intended to take their UASD program further than it has gone. They provided a great service to us for several years and led the way for a number of excellent programs for our Uniden radios to take its place. There's no need for the UASD program any longer - it served its purpose and is no longer needed. I believe Uniden is now doing exactly what they do best - focusing on the future generations of our radios, planning for new ones and what they'll enable us to do with them - hopefully over the next decade and beyond!

Shelley

Only one problem.
Software for the BCD396xt was promissed by Uniden.
They also said there would be Uniden software for the BC346xt for
purchase from them.

There's no need for the UASD program any longer - it served its purpose and is no longer needed. I believe Uniden is now doing exactly what they do best - focusing on the future generations of our radios, planning for new ones and what they'll enable us to do with them - hopefully over the next decade and beyond!

It seems to me that "need" isn't the question. It was represented
that it would be provided and it hasn't been. While I'm pleased with
my Uniden scanners and with the third party software which I'm using
to program and operate them, the failure to provide what was
represented to be included certainly impacts on my opinion of Uniden.

Futhermore, many people that have used the USAD software in the past
are legitimately unhappy that they now have to obtain and learn to
use some other software.

I would think that the potential legal liability alone would have
motivated Uniden to come up with the software even if they don't care
about the diminution of their reputation.

I'm not suggesting that I have any intention of initiating legal action. What I'm saying is that when you pay for a product you are entitled to receive what it was represented you would receive. The failure to receive what you paid for is your harm. These are the kinds of things which lead to class actions. It seems like a bad corporate decision to fail to provide what was promised.

I have neither the desire nor the intention of debating whether such a suit would be successful or whether one should or shouldn't be able to bring such a suit. I'm only pointing out that there is potential legal liability when one fails to deliver what was promised.

Hello,

FWIW in this thread, UASD for the BCD396XT is in active development right now.

There are those that are of the opinion that Uniden should not have released the BCD396XT until its UASD software was ready. Ludicrous opinion, but that doesn't stop some from having it.

Many have said that Mel, but they would be the same ones whinning if they had to wait for release of the scanner too. No matter what someone WILL complain about something....even the lack of a hardcopy manual.... something I don't miss a bit as it's always available online with the latest updates whereas the hardcopy manual would be well outdated now with the changes made since the scanners release

People ask for it because they've used it in the past. But there are other free alternatives for them to use now. I'm not trying to defend Uniden, I'm simply saying that they're not in the software business. And there are other software programs which are free and can import the Uniden software data with no losses. Personally, I have no idea why they haven't released an updated copy of the program but from a business point of view and considering the economy, I believe there are good reasons why they haven't - none of which I could disagree with.

I can't imagine people not needing the software anymore. The only other program for this scanner seems to be the freescan which really only runs on Vista windows. I was borrowing someone else's XP computer to load freescan and .net but discovered it broke other programs on this person's work computer. I had to spend the weekend reloading it for him. (Don't get me started on how much I hate windows :-/)

The UASD ran on both my mac and linux boxs.

If I could get the source code for the UASD, I could update it.

You are right that the programming software is almost a requirement. As
for FreeScan, I have run it just fine on several Windows XP computers
along with a Windows 2000 computer. No problems on any of them.

I assume that you mean that the only other _free_ program for this
scanner is FreeScan. There's ProScan and ARC-XT, of course, as well,
but they aren't free. However, they do have 30 day free trials.

I've run FreeScan on XP, Vista, and Windows 7 with no problems. To
say that it only runs on Vista because you had a problem on a single
computer is a bit of an exaggeration at best.

Hi Shelley,

If they aren't going to make the software
they should have said that. They are a big company and certainly have the ability to make the software. Like much of corporate America they don't care. They should have had the software ready to do when the scanner was released.

The problem is: they have idiots like us who buy this stuff, no matter what.

Hi Ray :)
Hey, I understand completely where you're coming from and what you're saying! The only point I was making was what I've seen and experienced over the years. So often when a "hardware" company produces a piece of software, the company is doing it as a "benefit" for the customers buying a (usually) new-to-the-market piece of hardware. When/if the hardware proves to be very popular, software developers write software for it (which is exactly what the hardware company is hoping they will do). The people at Uniden are no fools! They knew that they were bringing a great radio to the market and putting a piece of software with it was pure icing.

Did they make a mistake by saying they were bringing an updated version with our XT? Indeed! Should they have subsequently said they couldn't get it done? Yes, they should have. But the point I've made all along is that Uniden is not in the business to produce software - they work on excellent hardware. And, in this economy, I don't think they'd even consider putting ANY resources into rewriting the software.

I got a CD w/software for the psr600 but it isn't much to talk about and it wasn't free and it had to be purchased from a seperate vendor, never did much with it though, pretty much useless stuff, at ;least Uniden makes descent software, so this one has issues and is a bit late coming out, better late than nothing at all like some companies

John

You want to do a "quicksave all groups" then copy the files to CD-RW or Another drive/directory. Also you want to do a save profile and move it to the same place. The profile is what you load to have all the groups load.

I had problems programming my 396xt with Freescan, almost like it wasn't downloading all the data correctly from RR, or if it was then it wasn't uploading it to my scanner. Tried several times before switching to ARC XT Pro, which worked straight off. I guess with Freescan you get what you pay for ;)

Joe, sending the file loaded on my scanner April and most recently in December. I do see somethings that look different but I am too new at this to figure out if things need to set differently to work better with the local systems.

Thanks for taking a look. Folder with my name will be uploaded to files in a few minutes.

With the 396XT you actually do have to use it - if you hook up an outdoor antenna.

VHF-Airband and VHF (reception) are easily overloaded on the 396XT when using an external antenna.

I don't. Although I do have to use it on other scanner models.

Still, if you're in a very heavy RF area, you might have to use it on
any scanner.

What type of interference are you getting?

The 2006 and 90 are old enough they likely won't have any problems. It's primarily the more recent models that are more prone to overload.

3566. Re: Attenuator

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-01-21 07:12:32 UTC
From: nickcarr3151
Topic: 3557 Message: 3566

It has nothing to do with interference.

Example:

Semi-weak signal on 169.0 mhz on 396XT with rubber duck
Switch to R/S Pro 2006 (hooked up to external antenna) - signal is full strength
Hook up external antenna to 396XT
396XT hears washed out signal (think of strong signal plus lots of white noise)
Enable ATT on 396XT
Signal is decent; white noise is gone

This happens on VHF-FM and VHF-AM (Air); happens with my BCT-15 as well.

External antenna is R/S Discone on top of roof from suburb location.

3567. Re: [BCD396XT] Re: Attenuator

Topic: 3557 Message: 3567

Sorry to contradict you, but what you described is in fact interference - specifically receiver desensitization (AKA desense) from strong nearby transmitter(s) in the same or adjacent band. I would guess Broadcast FM or a NOAA transmitter, or possibly a TV transmitter on channel 7-13 (RF channel, not what they call their channel - they are no longer the same thing in most cases since the transition to DTV). For example, my Channel 2 transmits on RF Channel 25 now.

And yes, the attenuator would act exactly as you describe. Hence, we are back to my original statement: "if you're in a very heavy RF area, you might have to use it on any scanner."

And you have to be in the field of a strong RF source in the band for this to happen. In fact, the more sensitive the receiver, and the less effective the front end filtering, the more this will happen and the weaker the signal will appear to be (until you turn on the attenuator).

Why doesn't it happen on your older scanners? Better band filtering. They are just as sensitive, if not more so, but the filtering simply is attenuating that signal before it gets far into your receiver.

From: shelleysh1@att.net
Topic: 3557 Message: 3568

I don't have to use the attenuator at home, on my outside antenna, either. But there are times when I probably could be using it mobile. There are two places in St. Louis County where I'm running into some heavy RF, but both the areas are small in diameter and thus haven't presented any significant problems for me. But I haven't had any problems at all with the outside antenna (an Austin Ferret), nor have either of two locations where I have installed the same antenna. One is using a 396XT and the other usually a 996XT, but occasionally will use a 396XT.

3569. Repeater input frequencies

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-01-27 22:13:00 UTC
From: Alex
Topic: 3569 Message: 3569

I was scanning the wiki but couldn't quite find the information I hoped for. Does the XT understand repeater input frequencies so that it can check them as it scans by the output frequency or do I have to add all input frequencies as separate entries? I'm trying to listen to a system that sends mask tones on the repeater output. The repeater is only being used for one way communication and any radios out in the field are transmitting directly back so I miss half the conversation.

Topic: 3569 Message: 3574

You have to program them separately. Program the input first so it doesn't stop on the output which is masked before it checks the input for activity.

Joe M.

Alex wrote:
> I was scanning the wiki but couldn't quite find the information I hoped for. Does the XT understand repeater input frequencies so that it can check them as it scans by the output frequency or do I have to add all input frequencies as separate entries? I'm trying to listen to a system that sends mask tones on the repeater output. The repeater is only being used for one way communication and any radios out in the field are transmitting directly back so I miss half the conversation.

bcTool does not support the XT series. A rewrite of bcTool is underway
which will support them, but no projected release date yet.

I don't believe that bcTool supports the 396XT model. You might look at FreeSCAN at www.scannow.org as it does. It also supports the 396T model if you still have it to read from then upload to the XT.

Yes. Go to any office supply store that provides printing service, and let them print the CD for you. They will return your CD with a printed copy. Yes, I *am* serious. I know many people who have done this.

CSV means comma separated values:

Polk County PD & FD Frequencies,
154.235,Fire Dispatch
154.235,Fire
154.280,Fire
153.830,Fire

In Free scan open a system and select the group or frequency list you want
to import into.

Copy the CSV values from a text editor like Notepad, Notepad++ or Textpad
to the windows clipboard. Select the text and press control-c keys.

In Freescan press the EZ-Grab Button
In the Delimiter frame select Comma radio button

In the This Should be treated as: field
set the type of fields in this case field 1 is frequency and field 2 is
the Name.

Press the Copy from Clipboard button.

You can delete lines in the table list you don't want using the delete
button.

When the list is as you like it press the import into Freescan button then
press close.

Can some one help me program my 396XT using ARC XT PRO software?

3587. ProScan Ver. 4.2 Is Out.

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-01-30 01:59:23 UTC
From: bob_proscan
Topic: 3587 Message: 3587

ProScan supports the BCD996XT, BCD396XT, BCT15X, BC346XT, BCD996T, BCD396T, BCT15, BR330T, BC796D, BC785D, BC780XLT, BC296D, and the BC250D scanners.

* Added - History and Recording column resize and reorder capable.
* Added - Web Server - IP addresses logged to the Web Server Log.txt.
* Added - DMA portable scanner type - Put back in the Function Hold button on the virtual keypad.
* Added - Web Server and ScanCast - The current and peak listeners are shown.
* Added - Web Server and ScanCast - Metadata tag streaming added Unit ID's to the custom format.
* Added - Web Server and ScanCast - Metadata tag streaming added option to get data from file.
* Added - ScanCast - Secondary check if the IceCast / Shoutcast server is not responding. Before only the TCP connection is checked.
* Added - Audio level indicators now are colored green to yellow to red.
* Changed - History logging consolidated the Frequency and Talk Group ID grids.
* Changed - DMA DB - Only show the "Save Current Data" when the file closes if the data has changes.
* Changed - Web Server and ScanCast - Changed the method of streaming tags to the in-band method on IceCast servers. WinAmp now shows the tags instantly.
* Fixed - UID was showing only six digits instead of seven.
* Fixed Standard rebanding calculation.
* Fixed - ProScan Icon option set to "Display Colors" could cause application crash.

3593. Kudos to UPMan, Uniden and Beta Testers!

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-01-30 18:45:06 UTC
From: JETorres
Topic: 3593 Message: 3593

I finally got my hands on a BCD396XT and I gotta say that all the improvements and new features are absolutely great when comparing to earlier scanners.

Our local VHF P25 system works great out of the box without any tweaking. The Unit ID feature works more reliably than the GRE counterpart. It evens keeps up with my XTS5000 as far as switching user IDs in the middle of a transmission.

The muting and skipping of encryption is a very welcome and reliable feature.

The VHF reception seems to be improved, even with the stock SMA antenna.

The scanning speed between sites and systems is very fast.

The multi-site support was a much needed feature and it helps a lot by saving time and memory when programming big systems.

The Fire Tone-Out feature works as advertised so far.

The Control Channel Output feature is another great addition.

There's so many more things I've found to be much improved and many others I haven't played with yet. In the near future I'll be posting my constructive criticism and other suggestions for improvement as I encounter them.

Thanks for listening and supporting the scanning community Paul/Uniden. Much thanks to the beta testers too! Keep up the good work everybody!

3595. Two questions

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-02-01 13:50:56 UTC
From: Patrick M. Valentine
Topic: 3595 Message: 3595

1. I have the BCD396XT, it was pre-programmed at the place I purchased it from. Channel 1 is the Gibraltar TRS and Channel 2 is the Downriver TRS. How do I turn on and off Channel 2 so that I can listen some times, but normally will be listening to Channel 1.

2. The scanner was pre-programmed with some personal information that I either gave to them incorrectly or they entered it wrong. When I turn on the scanner this information appears in the window. How can I correct this information?

3. I'm not familiar at all with scanners. I have looked at the CD that came with it, as well as the web site. All I want is an Owners Manual with all the basic information that I can print and read so that I can be familiar with the scanner. I find the CD and the web too difficult for me to understand. Any solution?

Thanks.

3596. Re: [BCD396XT] Two questions

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-02-01 14:16:54 UTC
From: Uniden UPMan
Topic: 3595 Message: 3596

That's three questions, but I'll cut you some slack for the bad math, this time (since your spelling was impeccable). ;)

1. Really depends on how it was programmed. TRS's don't go into channels, they go into systems, which contain the site frequencies and the channel groups/channels. If they assigned an SQK (System/Site Quick Key) to the two systems, then you would use those to individually turn the systems on and off. So, for example, if Gibraltar is assigned to SQK 1 and Downriver is assigned to SQK 2, you'd press 1 while scanning to toggle Gibraltar on and off and 2 to toggle Downriver on and off. In the next-to-bottom row on the display, there is a line that might look like:

S0: 12--------

If so, then that is how the systems were set up. Otherwise, it just depends.

2. You need to use software to change that information. Available software is:
Freescan (www.scannow.org)
Proscan (www.proscan.org)
ARC-XT (www.butel.nl)
Scancat (www.scancat.com)

Software would also let you quickly make changes to the programming (like adding SQKs if none are assigned). You'd read out the scanner's programming, make whatever modifications, then write it back. With a premium membership to RadioReference.com, you could also directly import radio system information into the software (saves a bunch of typing).

3. Bonus answer for the bonus question: There is a printable version of the web site at:
http://info.uniden.com/twiki/bin/view/UnidenMan4/SiteExport
There is also a printable Complete Reference Guide for the scanner at:
http://info.uniden.com/twiki/pub/UnidenMan4/BCD396XT/BCD396XT_Complete_Reference.pdf

Subject: [BCD396XT] Two questions

1. I have the BCD396XT, it was pre-programmed at the place I purchased it from. Channel 1 is the Gibraltar TRS and Channel 2 is the Downriver TRS. How do I turn on and off Channel 2 so that I can listen some times, but normally will be listening to Channel 1.

2. The scanner was pre-programmed with some personal information that I either gave to them incorrectly or they entered it wrong. When I turn on the scanner this information appears in the window. How can I correct this information?

3. I'm not familiar at all with scanners. I have looked at the CD that came with it, as well as the web site. All I want is an Owners Manual with all the basic information that I can print and read so that I can be familiar with the scanner. I find the CD and the web too difficult for me to understand. Any solution?

Thanks.

Ok, once again I humbly ask for help.

My BCD396XT scanner has mysteriously locked in the "Close Call Hits" mode and I can't seem to figure out how to get out of it.

Any Help?

Thanks,

Ralph, VE3EUK

Sounds like you've locked/disabled everything else.

Try enabling some SQKs and/or GQKs (System or Group Quick Keys)
or
Unlock some Systems/Groups/Channels.

I assume you've tried resetting the power which would clear any
temporary lockouts. But then, your Close Call Hits mode should be clear
if you've cycled the power.

Hi,

I am in the formative stage of planning for the purchase of a 396xt.

When that time comes, I will be using a borrowed pc (I'm a Mac guy). Will the borrowed pc need any special software to use the programming software that is around? Also, how involved is it? I'm not a great pc user but can get around most programs.

Any tips on programming... very appreciated!!!

Walt

Hi Walt,

I¹m in the same boat as you. A friend of mine with a PC was kind enough to do the programming for me. Good luck with it! This is not your ³Bearcat 210² of the good old days. I have found that my new radio is nice and small, lightweight, excellent reception with excellent audio, however.....I have to be honest and say that it¹s a bitch to learn. I¹m slowly getting more comfortable with it, but I¹m still not able to wrap my mind around the fact that it does not have channel numbers---only memory. I know there are tags that can be assigned, but I somehow messed that up and need to figure it out again.

Good luck with everything!

When you decide on what software to use, look at the requirements for that software.

Andy, just think of the new scanners like your PC, where the files (i.e. freqs and TGs) are divided up into separate folders (i.e. systems) instead of all being in the root directory as was with the old scanners.

If every file on your computer was under the C:\ drive then it would take you forever to find anything!

The ARC software does not require any additional libraries, but Freescan requires .NET libraries from MS.

3605. RE: [BCD396XT] Kudos to UPMan, Uniden and Beta Testers!

Just wanted to add my 2 cents to the converstaiton. I would like to say that I am proud owner of a New BCD396XT radio and I am blown away by how well it performs. I had originally purchased a GRE PSR500 over the Uniden, big mistake. The GRE unit just did not pick up like the Uniden, I would like to also say Kudos and big job well done. I will never go back the other way and be Uniden bound from now on.

To: BCD396XT@yahoogroups.com
Subject: [BCD396XT] Kudos to UPMan, Uniden and Beta Testers!

I finally got my hands on a BCD396XT and I gotta say that all the improvements and new features are absolutely great when comparing to earlier scanners.

Our local VHF P25 system works great out of the box without any tweaking. The Unit ID feature works more reliably than the GRE counterpart. It evens keeps up with my XTS5000 as far as switching user IDs in the middle of a transmission.

The muting and skipping of encryption is a very welcome and reliable feature.

The VHF reception seems to be improved, even with the stock SMA antenna.

The scanning speed between sites and systems is very fast.

The multi-site support was a much needed feature and it helps a lot by saving time and memory when programming big systems.

The Fire Tone-Out feature works as advertised so far.

The Control Channel Output feature is another great addition.

There's so many more things I've found to be much improved and many others I haven't played with yet. In the near future I'll be posting my constructive criticism and other suggestions for improvement as I encounter them.

Thanks for listening and supporting the scanning community Paul/Uniden. Much thanks to the beta testers too! Keep up the good work everybody!

Same here. I had the 396T for a lonnnng time and just recently sold it and bought the 396XT. It's just incredible. Many many many new features. I knew from reading about it that it had some new features added but OMG.....tons of new features. I love the temporary lockout feature and the multi-site system support and the speed and sensitivity...Close Call seems to be more sensitive also. Love the 500 talkgroups per system instead of the 200 on the 396T. Only thing i would ding it on is the output of the headphone jack audio...It's lower and really won't drive an extension speaker. but I've been using a cassette adapter when in my car and it's awesome. Going to buy a bluetooth transmitter thingy so I can roam around at work and listen without the scanner clipped on me and looking like a geek. Great job UPMan! Looking forward to any firmware upgrades that'll open up any other cool features....already did the Unit ID upgrade and that was awesome.

3607. Regarding the use of ARC software

The ARC software has a trial period. Try it and decide for yourself.
Knowledge of Trunking is
always helpful. ARC Pro just has more features, as in logging, etc.

That's because it's an earphone jack and not an external speaker jack.
It was not designed to drive a speaker, so the criticism that it will
not really isn't justified. If it could, there would be lawsuits from
people driving the earphone to levels that would damage their hearing.

Wow...wonder how many lawsuits have been filed on the 396T which drove that external speaker just fine.....and that extension speaker is MADE for scanners earphone jack. I was trying to imply how much I enjoy the scanner, not criticize it or hurt anyone's feelings. I don't know about most people, but if I had a headphone or earphones plugged into that jack and it was loud, I would turn that little black knob on top counter-clockwise and remedy the situation. people in this country are getting so wuss-ified and lawsuit happy. Get real people who would file a lawsuit against some manufacturer who "warned you to begin with by the way" to be careful when listening with headphones/earphones. Same category as someone filing a lawsuit against McDonalds because the spilled hot coffee on themselves. Anyway!!!!! Again....awesome scanner UPMan and Uniden!!! Awesome.

Uniden has that covered:

EARPHONE WARNING!
Be sure to use only a monaural earphone with this scanner. You can also use an optional 32 Ω stereo headset. Use of an incorrect earphone or stereo headset might be potentially hazardous to your hearing. The output of the phone jack is monaural, but you will hear it in both headphones of a stereo headset.
Set the volume to a comfortable audio level coming from the speaker before plugging in the monaural earphone or a stereo headset of the proper impedance (32 Ω). Otherwise, you might experience some discomfort or possible hearing damage if the volume suddenly becomes too loud because of the volume control or squelch control setting. This might be particularly true of the type of earphone that is placed in the ear canal.

How many lawsuits? Who knows. It could be none, but Uniden might just be complying with a federal mandate that earphone levels not exceed X dB - similar the the mandate that requires the weather alerts to be at *least* X dB. Or, they may just be adopting a "CYA" philosophy.

Which speaker are we talking about?

An extension speaker made for an earphone jack should have an amplifier built in.

There are three types of jacks that scanners have:

1. Earphone jack - designed for 32 ohm earphones only. I believe the Uniden manual states this specifically.

2. External Speaker jack - designed to drive external (or extension) 8 ohm speakers.

3. Line Out jack - designed to provide fixed, standard line level audio. This level is on similar lines as the earphone jack, and can be used with an external speaker provided it is an amplified speaker. Some people might find the level acceptable with non-amplified speakers.

Will one work with another type of jack? Yes - sometimes.

All this said, is it possible you had the audio on the 396T raised artificially, such as having the channels programmed for NFM when the signals were FM, but the XT has the mode set correctly?

Is it possible your 396T was modified to raise the level of the earphone jack? Yes, there are mods out there to do this, but the proper way to deal with not having the correct jack type is to compensate for it with your device - such as using an amplified speaker for an earphone jack output.

As for intent of criticism, I don't see how "would ding it on" is anything short of criticism. True, not very harsh criticism, but if you want to replace that word with "critique", that is fine with me. Even if you want to continue to call it a 'ding', that's fine. Just change my reply to the effect that the 'ding' is not justified, as the earphone jack was not designed to drive an 8 ohm speaker.

As for the "people in this country are getting so wuss-ified and lawsuit happy.", that is absolutely true, and Uniden's decision to take preemptive action against a stupid lawsuit is the type of thing we will see when the courts rule in favor of people who had the ability to do stupid things, then sue for it. The courts have ruled it is the responsibility of the manufacturer to make sure people can't do stupid

things, or be held liable if they can.

We definitely agree the XT is an awesome scanner. The only thing we seem
to disagree on is whether an earphone jack should be able to drive an
external speaker. Again, Uniden states that it is for earphone use only.

Joe M.

I stuck with my old non-trunking scanner for over 10 years. When I finally made the leap to catch-up to modern times (with the BCD396T) I faced a considerable learning curve regarding trunking systems, alpha tags, radios with "systems" and "groups" instead of "banks" and "channels", etc, etc.

Nontheless, after about a week of trying things off and on I was able to use ARC396Pro, the easy programming link to RadioReference, and the radio itself with no problem.

You have to do some studying and learning. Join the ARC396XT Yahoo group and research the archives. Every question you can think of has already been answered there.

The linkage to RadioReference is what simplifies everything.

I don't think you need the Pro version until you want to get into logging, recording, PC control of the scanner, etc.

Hi,

Sorry to be grump, but I don't think anyone deserves Kudos, certainly not Uniden. Where's the USAD Software Paul? If you're not going to make it available, let is know. I think it's sleazy they couldn't bring the software out at the same time as the Scanner. Uniden's a big company, they should have had the software out months ago.

If that were true, then it would not work with USB, either, as all the USB adapter does is create a virtual serial (RS232) port for applications like Freescan to address. To Freescan, there's no difference between the virtual serial and actual serial hardware...

From: MCH
Topic: 3607 Message: 3618

Odds are the USB cables will not work either since they are nothing more
than serial cables with a USB-to-RS232 adapter. Once the adapter is
installed and the COM port assigned, there is no difference over a
serial port. In fact, if anything the serial port is more reliable since
you don't have to convert to USB format than back.

Are you sure it's a FreeScan issue and not a Windows 7 issue with it
recognizing COM ports? What port number is assigned to your serial port
in the Device Manager? Does it show as being present? If not, FreeScan
has nothing to do with the issue.

If you have a system containing groups and you select Func then the group number it selects or deselects that group, can someone tell me if i deselect all my groups in the system how i select them again, my radio tell's me there's "Nothing to Scan" and i can't get my groups back which means I cannot use that system again until i use some software to select the groups again.
Please help, lonely UK user

Well I was answering Walt's question which did not mention windows7. I can't see why it wouldn't, but check scannow.org, or search RR for compatibility.

Mel

Freescan does not work with a serial cable on Windows 7.

Waiting for a USB cable.anyone can confirm that works?

>Why not just try FreeScan, it may and probably will be all you need.

Mel

Hi,

Using the ARC sortware... in your estimation... is it straight forward for a

neophyte or does it expect a certain amount of additional knowledge of trunking and scanner setup with "control freqs" and other things? Would the Pro model of the ARC SW be easier to use than the regular version?

Works just fine here with a serial cable and Windows 7.

I find it interesting the way people generalize that something
doesn't work generally just because they can't get it working on
their specific computer with their specific setup.

I personally don't think it is sleazy....Paul does what he can for us...AND....he has a family to feed: He isn't Uniden all by himself. He has a chain of command like we all do. I know he tries and often cannot be too revealing. It is his job, afterall.Candy bars are smaller, hamburgers and their buns are shrinking everywhere, cereal boxes are smaller.....and all the prices go up and then "Guess what?..We are gonna give it to you for $1!!!!....those are legit gripes. I think Uniden provided us with a fantastic unit. I can't recall what was said about development of software but, if it is in development, I am curious about that. The old 396T software was great! I do look forward to the XT version....if it is forthcoming.

I don't usually include my signature block on these mails but for the sake of clarification this time I will.

I've been testing and running Windows 7 for well over a year as part of Microsoft's private testing group. Additionally I've been recognized by Microsoft's Server Product Group as a Most Valuable Professional since 1997. And I hold a B.S. in Computer Information Systems.

Computers in general and Windows 7 specially are something about which I'm quite qualified to comment on.

I've also had a GRE PSR600 for nearly 2 years, running PSREdit on Windows 7 machines (32 and 64 bit) with out issue

This past weekend I decided to pick up the 396XT at the Winterfest in Collinsville IL

The same hardware configuration on a Windows 7/32bit box that does not work with freescan, works just fine with ARC396XT

I'm likely to try the USB cable even if it only works on the ARC software since my laptops don't have serial ports

What makes that odd is the fact that there are people who are running it
fine under the same OS.

Maybe you (vs the others) have different .NET framework installed?

With your background, I'm sure Assaf would appreciate any insights you
have into the cause.

I have no doubt that you are well qualified to determine that
FreeScan isn't working on your computer. However, it works just fine
on mine with a serial cable and I took (take) issue with the
generalization in your first post that "Freescan does not work with a
serial cable on Windows 7". You, in light of your qualifications,
should know that it is inappropriate to generalize from a very
limited sample. Perhaps you should have said that "FreeScan doesn't
work on my Windows 7 computer."

It seems to me that those types of comments can cause freeware
authors to decide that it just isn't worth the hassle.

FreeSCAN is written and compiled under Win7 so it should be compatible. Not sure why it is not working for you, if it is not communicating with the scanner then you should check the COM port settings. Thats the only thing that can be wrong if your scanner is working with other scanner.

From what I have read on the boards they do have a guy working on it full time. What could possibly be taking so long.. well.. who knows. Nothing official is available other then a few posts from Paul indicating that it is slowly coming together. There is no denying that there is a demand for UASD, for reasons that baffle many of us as it is a stripped down, featureless program with a crude interface. But despite the alternatives available people still seem to really want it. I imagine the same kind of people that buy VW Rabbits.

Anyways that is my $.02 take it or leave it.

Based on past UASDs, because it's nearly impossible to break (very few bugs, and what bugs there are can be avoided) and uses the same format data and terminology as the scanner. Likely also for the same reason so many other people say "X SW is the best"... because they know how to use past versions, so the new versions are easy to "learn".

It is clearly the best tested SW package. Granted, it is low on "bells and whistles", but maybe those things just confuse some people.

Gee, an unbiased opinion? Or does the fact that you created a competing
S/W enter into the equation? Why didn't you identify yourself as such?

UASD may be "stripped down" but it has always filled a need for many users
as well as filling a gap in the software
side of things. For the basic users it's more than adequate and it does have
some things for the more advanced users as well.

Unbiased indeed. Since I do not sell any products I do not try compete with UASD or anything else. I do make a free alternative available out of the good of my heart. It's not always perfect but there are worst choices out there.

I quite like Freescan. Thanks Assaf.

I always thought that Uniden should do themselves a favour and just buy the rights to your software and distribute it with the scanner.

Sometimes we miss the smallest detail that (of course) ends up being the one thing that's "stopping the train from running."
Advanced knowledge is a wonderful thing. Coming from a field where that's vital, I appreciate the OP's position. But we all miss things. So go back and try it again. Look for that "little thing." And when you find it, please let us know what it is!
I'm a very happy user of FreeSCAN. Assaf has done a simply wonderful job. I have a USB-serial converter cable that Best Buy sells for around $15. Comes with drivers on a mini-disc.

>FreeSCAN is written and compiled under Win7 so it should be
compatible. Not sure why it is not working for you, if it is not
communicating with the scanner then you should check the COM port
settings. That's the only thing that can be wrong if your scanner is
working with other (computers).

Assaf<

As for UASD... dear God, why???? As others said, it's a terrible program. No offense, Paul O. and Uniden, but when I bought my first 396, I couldn't wait to get rid of UASD and spend money on the BuTel software. With the 396XT, I haven't missed a beat using FreeSCAN. Simply brilliant radios....not so much with the Uniden software.
Perhaps wanting UASD is similar to wanting a paper manual.....

SUGGESTION for UNIDEN: contract with Assaf to write your scanner software!

You can say that about *any* SW package you don't know.

UASD's forte is that it simply works. There are fewer bugs in it than in
any other SW package.

Granted, the support is slow, and there are few bells and whistles, but
I think it was never intended as anything more than a basic programming
utility at which it does an outstanding job.

I agree freescan has been great. I can't go back to UASD now nor do I want to.
I deal with so many models of scanners and I can simply hook up another DMA scanner and upload the same file to each. I can't do that with UASD.

Assaf also mentioned that its his own opinion (his 2 cents)... He (like everybody on here) is entitled to their opinion.

> Please help, lonely UK user
>

There have been several answers to this I see, but what I did was to program a group that does not have a group Quick Key, with one channel that will never receive anything in each system. That one channel does not get turned off with Group Quick Keys so the system always has SOMETHING to scan. I call the group "Keep Alive" and the channel I use is a UHF TV channel with a DPL set (that of course will not decode on a digital TV signal).

Same here. I have a 396T, a 996T, and a 396XT. With FreeScan, I just have one file for all three. The only think I have to do different is I have 2 large trunked systems that I actually have twice - a large and a small version. The small version goes into the 396T and the large version into the other two because of the larger talkgroup capacity.

The one thing that the UASD does that I wish the other programs would do. I program quite a few scanners for work. Most of the handhelds are 396T models. There are several different configurations (i.e. the cops get a different configuration that the fire guys, etc). Most of the difference is what systems are loaded. With the UASD, I can load a config file that loads a certain set of systems depending on who the scanner is for. If XYZ city changes some freqs, I edit the system file and now whichever config is loaded, the updated system (if included) is loaded. With the 796 scanners, I have to make the same change to as many as a dozen different files...

All the available SW has strong suits and weak suits.

There is no 'perfect SW'.

And on top of that, the one that is best for you depends on what you
want to do.

When I try to AutoDect my BC898T useing Rs232 communication setup under the BC898T tab I recieve the following message "ARC898T has not detected your scanner, please that the scanner is switched ON and connected. Also make sure the scanner is in remote mode." The scanner is in the remote mode. The scanner is connected to my laptop with a USB to Rs232 cable and the patch file. Any suggestions why the program can not find the scanner?
>
>

In the control panel check hardware devices to see if any com ports are listed.

If not then try this:
Unplug the USB device from the computer and reboot the computer, make sure that the "radio" serial port connector is NOT connected to the USB device (often windows will look for a modem to go with the USB serial device).
After the computer has reloaded open the device manager then plug in the USB device. Windows XP and above should indicate that it is installing the software for the device and then the device should display the device in the device manager. If that does not happen then you will need to reinstall the drivers for the USB device. If you have upgraded from XP to Vista or Win7 then you will need to upgrade the drivers for the USB device. If you need to reinstall the drivers unplug the USB device, run the driver install software, reboot, then plug in the USB device.

Once your device is recognized then you can connect your radio's serial port cable to the USB device.

Not a bad idea! Although history has shown there have been some great programs which, when purchased by large corporations, were never enjoyed (or as well supported) after the purchase, for many reasons.

Assaf has, in my opinion, never been biased. In fact, he's understandably been completely unbiased! I own (and support) his program, along with the other two which currently work on our 396XTs. Frequently I find that FreeSCAN will be the program I initially suggest to new users to try first. I do give them the list of the three programs but I've found that the user interface of FreeSCAN is sometimes easier for them to both use and subsequently begin to understand how the radio works.

Just my 2 cents. :)

Joe, I'm afraid I have to go with Gerry on this one. I was never a fan of the USAD software. It had nothing to do with support or bugs - it was, to me and I know to many others, a "clunky" program and was not the least bit intuitive. Even as a basic programming software program, users expect a basic intuitive program. Please know, I'm NOT dissing Uniden! Over the last 25+ years I've seen software such as this come out of corporations like Uniden and it's their genuine attempt to provide a service to their customer base for a hardware product they've got on the market.

There were and are many people who use and like the UASD software. I know this, although I honestly don't understand it. I do know it's an "apples and oranges" kind of thing but if one were to put the USAD software side-by-side with FreeSCAN, I can't see how they would choose UASD over FreeSCAN. Again, it's ONLY my opinion. (Not looking at updates, support, etc. ONLY looking at interface, user-friendly features, etc.)

Shell

**PLEASE NOTE - I compared UASD to FreeSCAN because they're both free programs. I didn't compare UASD to the other software programs since one has to pay for them, after a trial period.

program.<<

I meant that in the sense that there are constant comments that Uniden is somehow "screwing" their customers by not updating UASD for the XT... and all the while, far superior programs are already available.
As for "outstanding".... well, beauty IS in the eye of the beholder. :)

I have a like new 396XT for sale. Since I bought my 996XT for mobile/desk use I am no longer using the 396XT.

It works perfectly, has the original computer adapter, etc. I will sell for any offer over $400 and I will pay shipping by priority mail. I prefer to avoid using e-bay to sell the scanner but you can check my feedback there - 100% positive - my user name is "neilbell"

I accept paypal or US Postal money order or personal check (10 days to clear). Also available for personal pickup in the SF bay area.

Sale includes the original box, manual (on CD) etc.Please e-mail me off this list rather than clutter up the list. My e-mail address is:

neil<dot>bell<at sign>sbcglobal<dot>net

Actually it will run on Win2k or higher, so even if you have a 500Mhz machine you can run it. And if you Vista or higher, no .Net is needed. For the vast majority of users, it is very easy to install and if .Net is needed the installer will download it.

I agree that you cannot run it on non-Windows computers, but people who run Linux are people who prefer difficult solutions to simple problems, and there are too few Mac users to bother with.

You can use FreeScan which is free. If your computer has a serial port, you can use the cable that came with the scanner. If you have no serial port, you'll need either an adapter to convert serial to USB or a cable which includes such an adapter such as the Uniden USB-1. (If you have a computer which allows you to add additional circuit boards, you could, of course, add one or more serial ports in that way.)

If you sign up for a premium membership on RadioReference.com, you can directly download data from there into FreeScan, make whatever changes you desire, and then upload that data to the scanner. Without a premium membership you can still access the data and enter it into FreeScan using FreeScan's EZGrab feature. This allows you to copy and paste data and works well, but is not as quick and simple as the direct download.

FreeScan allows you to save your data into a file so that you can make changes as needed or desired and upload the modified data.

If you find that you want more features in your scanner software, check out ProScan and ARC-XT which are not free, but have 30 day trial periods.

3659. Re: [BCD396XT] Re: UASD Software Question.....

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-02-09 19:51:14 UTC
From: Brian
Topic: 3632 Message: 3659

Possibly....but I saw he had time to address a "How to remove the protrusion" on the back of the 346XT the other day. I'm just looking for an official answer. Today, next week, next month....sometime. It would make programming this gem slightly easier and less wear on my keys.

Also...I should have added the question....will the software have a rebanding table to make programming rebanded systems easier much like the 'other' softwares?.....

Thanks Joe!

I believe Paul is out of the country on business right now, so he may
have limited internet access, or more likely limited time.

You can use FreeScan which is free. If your computer has a serial port, you can use the cable that came with the scanner. If you have no serial port, you'll need either an adapter to convert serial to USB or a cable which includes such an adapter such as the Uniden USB-1. (If you have a computer which allows you to add additional circuit boards, you could, of course, add one or more serial ports in that way.)

If you sign up for a premium membership on RadioReference. com, you can directly download data from there into FreeScan, make whatever changes you desire, and then upload that data to the scanner. Without a premium membership you can still access the data and enter it into FreeScan using FreeScan's EZGrab feature. This allows you to copy and paste data and works well, but is not as quick and simple as the direct download.

FreeScan allows you to save your data into a file so that you can make changes as needed or desired and upload the modified data.

If you find that you want more features in your scanner software, check out ProScan and ARC-XT which are not free, but have 30 day trial periods.

FreeScan works great and is FREE.
You'll want to get a USB cord specifically for the BCD396XT
Subscribe to RadioReference. com for all your downloading needs.
That's it in a nutshell.
Enjoy1 Awesome scanner

I don't know if it will or not, but it's a trivial thing to add:

```
--------------------------------------
Band Plan Base Freq (Lower) Base Freq (Upper) Offset Polarity Spacing
1 851.025MHz 854.000MHz 440 + 25 kHz
2 851.0125MHz 868.9875MHz 0 + 25 kHz
--------------------------------------
```

No, it does not. It comes with a cable that has a DB-9 connector on one end and a proprietary connector on the other. It is in RS232 format from one end to the other.

If you need to adapt that to a USB port, you can buy the USB-1 or buy a RS232-USB adapter. I got one for less than $4 SHIPPED from eBay.

Yes, you can do it in a few minutes. I'm not aware of any limitation
of how much data you can download in the 30 day period.

However, I think you'll find that the 396XT does not come with a USB
cable unless Uniden has changed their practice which seems unlikely.

Windows market share: 92.2%. Apple: 2.92%.Not a lot of demand, so not a lot of incentive for some sort of "universal" solution yet.
It amazes me how hard it is to find someone that truly "loves" Windows, and it's exactly the opposite for Apple... yet most go for Windows, according to market share figures. The lower price of a Win machine must be more important than what you get for the money.

shelleysh1@att. net wrote:

> Not a bad idea! Although history has shown there have been

The only problem is for us other people who don't have windows puters. the UASD

software runs on most everything in emulation where-as freescan needs a current

windows puter and one with a specific version of .net.

If do decide to use FreeSCAN, it is a freeware program, so there are no time limits or other limits. If you want to use the RR Import feature, then you do need a premium subscription, but alternatively you can always just input the data into to the program, or use Ez-Grab to copy-paste from the website.

The RR web service gives you access to point-n-click hands-off programming, and some people prefer this, but you can do it all in a few minutes for free using the Ez Grab feature if you don't mind a bit of work. Since you only want to program one system, you might want to explore that route.

The wiki on here talks about importing & creating system more extensively:
http://wiki.radioreference.com/index.php/FreeScan_User_Guide

It's a standard DB-9 connector. Your Dell likely has one on the rear. It
will be blue in color.

For the laptop crowd (and even the desktop crowd), please note this is
not the same as the DB-15 video connector. Both are the same size and
shape, but the video connector has 15 pins and is male in gender (and
green on the Dell models) while the RS232 port will be a 9-pin female
connector (and as I mentioned blue on a Dell).

Some new computers come with serial ports and
others don't. If yours has one, you're all set
with the cable that came with the
scanner. Otherwise you'll need either the
adapter or a cable that contains the adapter such
as the USB-1 unless you want to add a circuit
board to your computer to provide a serial port.

It's not just the price although the differential is significant. I think the real reason is that Windows is used in the business world and those of us who work with computers (note correct spelling) are familiar with it. Why would I use a Windows based computer all day at work, then come home to a different system?

Windows market share: 92.2%. Apple: 2.92%.Not a lot of demand, so not a lot of incentive for some sort of "universal" solution yet.

It amazes me how hard it is to find someone that truly "loves" Windows, and it's exactly the opposite for Apple... yet most go for Windows, according to market share figures. The lower price of a Win machine must be more important than what you get for the money.

shelleysh1@att. net wrote:

> Not a bad idea! Although history has shown there have been

The only problem is for us other people who don't have windows puters. the UASD

software runs on most everything in emulation where-as freescan needs a current

windows puter and one with a specific version of .net.

We are really getting off topic here, but I think the reason is simple:

Microsoft made deals with PC manufacturers to include Windows with their products. If Apple had done it, MAC would be the popular brand (and be the one plagued with the most viruses).

Now that they have the lion's share of the market, they can also tout compatibility with most other computers.

But again, let's wrap up this part of the thread soon.

Joe M.

Derek Helling wrote:
> It's not just the price although the differential is significant. I think the real reason is that Windows is used in the business world and those of us who work with computers (note correct spelling) are familiar with it. Why would I use a Windows based computer all day at work, then come home to a different system?

I don't find many condescending, Derek. I think there were certainly a good number for a while, but these days the "outspoken" have really dwindled in comparison to what we saw for the first 15+ yrs. Back in the late '80s/early 90s I was one of the first Mac consultants here. But even then I worked both platforms. And yes, for years many Mac users have defended and touted their OS for many good reasons! Some (and often too many) took it too far. But that's what we've seen from all platforms in this kind of "competion". (Linux users are *very* strong supporters of their OS as well!) We ALL have our preferences and often "stand up" to support them. *smile*

Sorry to disagree with you, Joe but none of the current Dell laptops have a serial port. And, most likely, none of last year's models do either. I was able to custom build my Toshiba Tectra A-10 late this past year and it actually did come with a serial port (along with three USBs and an eSATA port). But I don't know of many laptops, if any other than Toshiba, where you can get a serial port any longer on a laptop.

3679. Would like a Pseudo-GPS Mode on the 396XT

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-02-10 03:05:42 UTC
From: tedrhayes
Topic: 3679 Message: 3679

I've been using my BCD396XT with GPS for several months now and would like to suggest some new capabilities that could be added (ideally through Firmware updates, but most likely in a future scanner model).

The GPS has work very well for me when I traveling in my car, but I don't generally use the GPS away from the car (I generally leave the GPS/power/external antenna in the car).

Of course it would be great if the GPS was integrated intothe scanner ☐ but that's a future model. Short of that, it would be nice if one could have a pseudo-GPS location mode (possibly the last GPS location received from the GPS; or a user input GPS location; or potentially a set ofuser defined GPS locations). In Pseudo GPS mode, the scanner could operate as if a GPS where connected (e.g.,when I'm at a fixed location such as home or in a hotel while traveling without an attached GPS) but would GPS-lockout systems out of range from the user selected/specified GPS location. (I could just leave the scanner powered on ☐ the GPS lockouts are justlike temporary lockouts ☐ but that isn't really practical).

When programming systems from several surrounding counties (both conv and trunked), I first started using separate Quick Keys for each county. However, I find it to be a pain to turn on/off all the keys when I don't have the GPS attached (I also could remember what I had programmed into each key). I've resorted to storing all the surrounding counties (outside of my "home" listening area) in one or two QuickKeys ☐ that makes it easier, but it still doesn't solve all the problems.

I live in western Ohio and have all the Ohio-MARCS sites (well over 100) programmed into one Quick Key. When the GPS is attached it works well. I usually turn it off when not using GPS (I have duplicate systems with just the "home" area sites).

I've had very good success using the scanner and GPS traveling halfway across the country. RadioReference and FreeSCAN or ARC-XT software has made it relatively easy to download and program systems from across the country.

Sorry for the long post.

Ted

Perhaps. But never-the-less, if the software was promised by Uniden and people based their decision on that promise, it should be delivered. I would not run my business with false promises to clients. Beside, my choice to not run a hackable computer OS has no weight on this matter.

Have you considered the use of start keys? When you are at home you turn on the scanner and press key for start key 1 and when using GPS on the road use start key 2 to activate those sites.

Here's the link to that county's page on RadioReference:

http://www.radioreference.com/apps/db/?ctid=1858

Note that at the bottom of the page there are
links to additional pages that contain
information for that county. Some of those lead
to more conventional frequencies (airport,
businesses, hospitals, railroads, schools) and
the last table contains links to all the trunked systems.

As you can see, "just one county" involves
considerable data and you'll have to make
decisions concerning whether you want all or just
part of it and, if just part, what part. You'll
also want to arrange that data in some way so
that you can listen to specific channels by
switching some of the channels on/off using the
System/Site and/or Group Quick Keys.

If I'm correctly understanding how the start keys work, I don't think that would help me.

I believe any given system can only be assign to 1 start key. I have too many systems that I want active whether I'm in GPS mode or not. And I already have enough "duplicate" systems. I've never found the current start key feature to be of any real use for the way I wish to use the scanner.

What I think would be a more useful feature would be what I'll call "User Defined Quick Key Sets". A user would set various quick keys on or off and then "save" that configuration to a "set name" or "set number"; the user would change the on/off quick keys and save another configuration. Each Quick Key Set (or configuration) would be used for my different "listening modes". A mechanism would then be required for the user to "select" the Quick Key Configuration, but with that I could quickly change from one configuration to another based on what I what to hear (e.g., home mode, travel mode, emergency mode, etc.). With such as feature, any "quick key" could belong to more than one listening configuration. This would give the user a much more flexible capability than the current start key functionality.

Yes, you would need to duplicate your systems for that scheme.

> If I'm correctly understanding how the start keys work, I don't think that would help me.
>
> I believe any given system can only be assign to 1 start key. I have too many systems that I want active whether I'm in GPS mode or not. And I already have enough "duplicate" systems. I've never found the current start key feature to be of any real use for the way I wish to use the scanner.
>
> What I think would be a more useful feature would be what I'll call "User Defined Quick Key Sets". A user would set various quick keys on or off and then "save" that configuration to a "set name" or "set number"; the user would change the on/off quick keys and save another configuration. Each Quick Key Set (or configuration) would be used for my different "listening modes". A mechanism would then be required for the user to "select" the Quick Key Configuration, but with that I could quickly change from one configuration to another based on what I what to hear (e.g., home mode, travel mode, emergency mode, etc.). With such as feature, any "quick key" could belong to more than one listening configuration. This would give the user a much more flexible capability than the current start key functionality.

You're fine Bill! The Dell Dimensions 2200 has a serial port on the back and you'll be able to run FreeSCAN on it with no problem.

ProScan 4.3.0 Is Out - Now Records In MP3

* Added - Recorder - Option for recording in MP3 or WAV format.
* Changed - ScanCast - Changed method to get the current listeners specific to RadioReference because of server relays.
* Changed - Custom program caption / title format.
* Changed - Recorder - Custom filename format.
* Fixed - Web Server - Certain media players was not connecting or took a long time to connect.
* Fixed - Web Server & ScanCast - Improved audio quality with the higher sample rates.

3692. Lockouts not transferring to/from radio

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-02-12 19:52:27 UTC
From: JETorres
Topic: 3692 Message: 3692

I noticed similar behavior using both, ProScan and FreeScan.

I lockout a bunch of TGs on the radio that are not labeled and some that are. I then download the contents of the radio using the said software. Many times the software doesn't even receive the unlabeled lockouts but it does show the labeled TGs. When the software does receive everything I had locked out, it still doesn't put them back on the radio when I do an upload.

Not sure if this is radio, software or operator error. I'm still learning all the changes on this model. So I'm willing to try any suggestions or provide more details if needed.

Thanks.

Were they Temporary Lockouts? Temporary lockouts are not downloadable
from the radio, only permanent lockouts can be downloaded from the radio.

If you use the regular serial cable, connecting it will not cause a Windows message for a device installation. You need to set the serial port address (Com 1 or Com 2 probably) in the software to match the computer. Once this is correct then you can try downloading the existing contents of the radio or connecting to RadioReference.

Hello,

What you want to do is not automatic. It's easy but not automatic.

You will need to make sure your scanner and computer are communicating first. Since you have an integrated serial port this should only be a matter of selecting the correct serial port in Freescan.

Click Scanner -> Control Scanner

Click on Comport Setup and choose one if you have more that one listed there. Then click on Start Virtual Control (assuming your scanner is connected and turned on) and you should see the display mirrored in the display on the screen. Or you can click on Start Auto from Comport Settings and it should detect your scanner automatically.

Once you are communicating with your scanner close those windows so that you are just looking at the main program window

Click File -> Import -> and then click either Radio Reference Conventional or Radio Reference Trunking. If you don't know the difference then you will need do some reading on RadioReference.com or your CD manual or Uniden's Twiki for the BCD396XT.

Once you do that and understand the difference, click Radio Reference Conventional or Radio Reference Trunking.

Assuming for discussion purposes you selected Radio Reference Conventional then you will see the Radio Reference Import screen.

Enter your Radio Reference username and password.

Then click Connect. If you connect successfully you will see Country in the left drop down box. If you are in the USA click the US flag.

Then click the Province/State drop down box and select your state.

The you can either click on the County drop down box and select your county or the Province/State Agencies drop down box and select a system there.

If you click on County select your county.You should the see the Groups tab populate with different conventional systems in your county.

You should see a few groups with check marks in the the boxes on the left. If you leave them all checked you can click the IMPORT button and they will be loaded into the left hand text box on the main screen of the program. When you are through with Conventional systems close this window.

Repeat this for the Trunking systems you might be interested in.

After you have populated this list with what you want to listen to there is one more important step before you send them to the radio.

Again, we are looking at the main program screen and text box on the left side that has the systems you have selected.

Click on each Conventional and Trunking system. In the panel to the right click the Quick Key drop down box.

There should be a list from 0 - 99 there. I suggest that you use 0 - 9 right now. Put conventional systems in one Quick Key and each trunking system in other Quick Keys between 0 and 9. If you have more systems than Quick Keys just put them in the same Quick Key as others. This way all the systems you program will be available in the first 10 System Quick Keys and can be selected or deselected by pressing digits 0-9. This is not optimal ultimately but is an easy way to start.

After you set Quick Keys for your systems you are ready to send the systems to the scanner. There are numerous other steps that you could take like selecting Group Quick Keys but you can learn about those after you are listening to things.

Now click on the button at the top that has a scanner and an up arrow on it.

You should see "Send to scanner" at the top of the window that pops up.

Click the Check All button. There are several other items that can be checked but you don't need to do so at this time.

Now click the Load Programming button and the software will send the systems you have selected to your scanner (assuming of course that you have made sure that the computer and scanner are communicating as explained above).

The little graphic below the button will be animated while the process is going on and when you are done a check mark will appear by the scanner and you will be done.

There is a lot more to it than this and I have left out some things that you will ultimately want to change but this should get you started.

Hope this helps,
Don, KE4JD

In FreeSCAN, if they are not saved to a group, they won't get downloaded. But the next version will fix this. Thanks for bringing it up.

Hello,

What you want to do is not automatic. It's easy but not automatic.

You will need to make sure your scanner and computer are communicating first. Since you have an integrated serial port this should only be a matter of selecting the correct serial port in Freescan.

Click Scanner -> Control Scanner

Click on Comport Setup and choose one if you have more that one listed there. Then click on Start Virtual Control (assuming your scanner is connected and turned on) and you should see the display mirrored in the display on the screen. Or you can click on Start Auto from Comport Settings and it should detect your scanner automatically.

Once you are communicating with your scanner close those windows so that you are just looking at the main program window

Click File -> Import -> and then click either Radio Reference Conventional or Radio Reference Trunking. If you don't know the difference then you will need do some reading on RadioReference. com or your CD manual or Uniden's Twiki for the BCD396XT.

Once you do that and understand the difference, click Radio Reference Conventional or Radio Reference Trunking.

Assuming for discussion purposes you selected Radio Reference Conventional then you will see the Radio Reference Import screen.

Enter your Radio Reference username and password.

Then click Connect. If you connect successfully you will see Country in the left drop down box. If you are in the USA click the US flag.

Then click the Province/State drop down box and select your state.

The you can either click on the County drop down box and select your county or the Province/State Agencies drop down box and select a system there.

If you click on County select your county.You should the see the Groups tab populate with different conventional systems in your county.

You should see a few groups with check marks in the the boxes on the left. If you leave them all checked you can click the IMPORT button and they will be loaded into the left hand text box on the main screen of the program. When you are through with Conventional systems close this window.

Repeat this for the Trunking systems you might be interested in.

After you have populated this list with what you want to listen to there is one more important step before you send them to the radio.

Again, we are looking at the main program screen and text box on the left side that has the systems you have selected.

Click on each Conventional and Trunking system. In the panel to the right click the Quick Key drop down box.

There should be a list from 0 - 99 there. I suggest that you use 0 - 9 right now. Put conventional systems in one Quick Key and each trunking system in other Quick Keys between 0 and 9. If you have more systems than Quick Keys just put them in the same Quick Key as others. This way all the systems you program will be available in the first 10 System Quick Keys and can be selected or deselected by pressing digits 0-9. This is not optimal ultimately but is an easy way to start.

After you set Quick Keys for your systems you are ready to send the systems to the scanner. There are numerous other steps that you could take like selecting Group Quick Keys but you can learn about those after you are listening to things.

Now click on the button at the top that has a scanner and an up arrow on it.

You should see "Send to scanner" at the top of the window that pops up.

Click the Check All button. There are several other items that can be checked but you don't need to do so at this time.

Now click the Load Programming button and the software will send the systems you have selected to your scanner (assuming of course that you have made sure that the computer and scanner are communicating as explained above).

The little graphic below the button will be animated while the process is going on and when you are done a check mark will appear by the scanner and you will be done.

There is a lot more to it than this and I have left out some things that you will ultimately want to change but this should get you started.

Hope this helps,
Don, KE4JD

Hello,

What you want to do is not automatic. It's easy but not automatic.

You will need to make sure your scanner and computer are communicating first. Since you have an integrated serial port this should only be a matter of selecting the correct serial port in Freescan.

Click Scanner -> Control Scanner

Click on Comport Setup and choose one if you have more that one listed there. Then click on Start Virtual Control (assuming your scanner is connected and turned on) and you should see the display mirrored in the display on the screen. Or you can click on Start Auto from Comport Settings and it should detect your scanner automatically.

Once you are communicating with your scanner close those windows so that you are just looking at the main program window

Click File -> Import -> and then click either Radio Reference Conventional or Radio Reference Trunking. If you don't know the difference then you will need do some reading on RadioReference. com or your CD manual or Uniden's Twiki for the BCD396XT.

Once you do that and understand the difference, click Radio Reference Conventional or Radio Reference Trunking.

Assuming for discussion purposes you selected Radio Reference Conventional then you will see the Radio Reference Import screen.

Enter your Radio Reference username and password.

Then click Connect. If you connect successfully you will see Country in the left drop down box. If you are in the USA click the US flag.

Then click the Province/State drop down box and select your state.

The you can either click on the County drop down box and select your county or the Province/State Agencies drop down box and select a system there.

If you click on County select your county.You should the see the Groups tab populate with different conventional systems in your county.

You should see a few groups with check marks in the the boxes on the left. If you leave them all checked you can click the IMPORT button and they will be loaded into the left hand text box on the main screen of the program. When you are through with Conventional systems close this window.

Repeat this for the Trunking systems you might be interested in.

After you have populated this list with what you want to listen to there is one more important step before you send them to the radio.

Again, we are looking at the main program screen and text box on the left side that has the systems you have selected.

Click on each Conventional and Trunking system. In the panel to the right click the Quick Key drop down box.

There should be a list from 0 - 99 there. I suggest that you use 0 - 9 right now. Put conventional systems in one Quick Key and each trunking system in other Quick Keys between 0 and 9. If you have more systems than Quick Keys just put them in the same Quick Key as others. This way all the systems you program will be available in the first 10 System Quick Keys and can be selected or deselected by pressing digits 0-9. This is not optimal ultimately but is an easy way to start.

After you set Quick Keys for your systems you are ready to send the systems to the scanner. There are numerous other steps that you could take like selecting Group Quick Keys but you can learn about those after you are listening to things.

Now click on the button at the top that has a scanner and an up arrow on it.

You should see "Send to scanner" at the top of the window that pops up.

Click the Check All button. There are several other items that can be checked but you don't need to do so at this time.

Now click the Load Programming button and the software will send the systems
you have selected to your scanner (assuming of course that you have made
sure that the computer and scanner are communicating as explained above).

The little graphic below the button will be animated while the process is
going on and when you are done a check mark will appear by the scanner and
you will be done.

There is a lot more to it than this and I have left out some things that you
will ultimately want to change but this should get you started.

Hope this helps,
Don, KE4JD

Hello,

What you want to do is not automatic. It's easy but not automatic.

You will need to make sure your scanner and computer are communicating first. Since you have an integrated serial port this should only be a matter of selecting the correct serial port in Freescan.

Click Scanner -> Control Scanner

Click on Comport Setup and choose one if you have more that one listed there. Then click on Start Virtual Control (assuming your scanner is connected and turned on) and you should see the display mirrored in the display on the screen. Or you can click on Start Auto from Comport Settings and it should detect your scanner automatically.

Once you are communicating with your scanner close those windows so that you are just looking at the main program window

Click File -> Import -> and then click either Radio Reference Conventional or Radio Reference Trunking. If you don't know the difference then you will need do some reading on RadioReference. com or your CD manual or Uniden's Twiki for the BCD396XT.

Once you do that and understand the difference, click Radio Reference Conventional or Radio Reference Trunking.

Assuming for discussion purposes you selected Radio Reference Conventional then you will see the Radio Reference Import screen.

Enter your Radio Reference username and password.

Then click Connect. If you connect successfully you will see Country in the left drop down box. If you are in the USA click the US flag.

Then click the Province/State drop down box and select your state.

The you can either click on the County drop down box and select your county or the Province/State Agencies drop down box and select a system there.

If you click on County select your county.You should the see the Groups tab populate with different conventional systems in your county.

You should see a few groups with check marks in the the boxes on the left. If you leave them all checked you can click the IMPORT button and they will be loaded into the left hand text box on the main screen of the program. When you are through with Conventional systems close this window.

Repeat this for the Trunking systems you might be interested in.

After you have populated this list with what you want to listen to there is one more important step before you send them to the radio.

Again, we are looking at the main program screen and text box on the left side that has the systems you have selected.

Click on each Conventional and Trunking system. In the panel to the right click the Quick Key drop down box.

There should be a list from 0 - 99 there. I suggest that you use 0 - 9 right now. Put conventional systems in one Quick Key and each trunking system in other Quick Keys between 0 and 9. If you have more systems than Quick Keys just put them in the same Quick Key as others. This way all the systems you program will be available in the first 10 System Quick Keys and can be selected or deselected by pressing digits 0-9. This is not optimal ultimately but is an easy way to start.

After you set Quick Keys for your systems you are ready to send the systems to the scanner. There are numerous other steps that you could take like selecting Group Quick Keys but you can learn about those after you are listening to things.

Now click on the button at the top that has a scanner and an up arrow on it.

You should see "Send to scanner" at the top of the window that pops up.

Click the Check All button. There are several other items that can be checked but you don't need to do so at this time.

Now click the Load Programming button and the software will send the systems
you have selected to your scanner (assuming of course that you have made
sure that the computer and scanner are communicating as explained above).

The little graphic below the button will be animated while the process is
going on and when you are done a check mark will appear by the scanner and
you will be done.

There is a lot more to it than this and I have left out some things that you
will ultimately want to change but this should get you started.

Hope this helps,
Don, KE4JD

Hmmmm, I wonder how this will play out with the Uniden software IF and WHEN it is released. I guess this may be a thing to try IF it is ever released. No one has commented from Uniden YET......on the software, that is.

Nope, they're Permanent Lockouts. And only the labeled ones are being transferred to/from the radio.

That's what I was doing this morning, I found a helpful map here:

http://forums.radioreference.com/california-radio-discussion-forum/150747-chp-frequency-use-map-corrections-needed.html#post1108559

That radioreference forum thread has a few good links.

I still need to hook my radio up to a GPS, have you already done that? I could use some suggestions as to what GPS receiver to look for, and how well that whole feature works.

Hello,

What you want to do is not automatic. It's easy but not automatic.

You will need to make sure your scanner and computer are communicating
first. Since you have an integrated serial port this should only be a matter
of selecting the correct serial port in Freescan.

Click Scanner -> Control Scanner

Click on Comport Setup and choose one if you have more that one listed
there. Then click on Start Virtual Control (assuming your scanner is
connected and turned on) and you should see the display mirrored in the
display on the screen. Or you can click on Start Auto from Comport Settings
and it should detect your scanner automatically.

Once you are communicating with your scanner close those windows so that you
are just looking at the main program window

Click File -> Import -> and then click either Radio Reference Conventional
or Radio Reference Trunking. If you don't know the difference then you will
need do some reading on RadioReference. com or your CD manual or Uniden's
Twiki for the BCD396XT.

Once you do that and understand the difference, click Radio Reference
Conventional or Radio Reference Trunking.

Assuming for discussion purposes you selected Radio Reference Conventional
then you will see the Radio Reference Import screen.

Enter your Radio Reference username and password.

Then click Connect. If you connect successfully you will see Country in the left drop down box. If you are in the USA click the US flag.

Then click the Province/State drop down box and select your state.

The you can either click on the County drop down box and select your county or the Province/State Agencies drop down box and select a system there.

If you click on County select your county.You should the see the Groups tab populate with different conventional systems in your county.

You should see a few groups with check marks in the the boxes on the left. If you leave them all checked you can click the IMPORT button and they will be loaded into the left hand text box on the main screen of the program. When you are through with Conventional systems close this window.

Repeat this for the Trunking systems you might be interested in.

After you have populated this list with what you want to listen to there is one more important step before you send them to the radio.

Again, we are looking at the main program screen and text box on the left side that has the systems you have selected.

Click on each Conventional and Trunking system. In the panel to the right click the Quick Key drop down box.

There should be a list from 0 - 99 there. I suggest that you use 0 - 9 right now. Put conventional systems in one Quick Key and each trunking system in other Quick Keys between 0 and 9. If you have more systems than Quick Keys just put them in the same Quick Key as others. This way all the systems you program will be available in the first 10 System Quick Keys and can be selected or deselected by pressing digits 0-9. This is not optimal ultimately but is an easy way to start.

After you set Quick Keys for your systems you are ready to send the systems to the scanner. There are numerous other steps that you could take like selecting Group Quick Keys but you can learn about those after you are listening to things.

Now click on the button at the top that has a scanner and an up arrow on it.

You should see "Send to scanner" at the top of the window that pops up.

Click the Check All button. There are several other items that can be checked but you don't need to do so at this time.

Now click the Load Programming button and the software will send the systems you have selected to your scanner (assuming of course that you have made sure that the computer and scanner are communicating as explained above).

The little graphic below the button will be animated while the process is going on and when you are done a check mark will appear by the scanner and

you will be done.

There is a lot more to it than this and I have left out some things that you will ultimately want to change but this should get you started.

Hope this helps,
Don, KE4JD

You can't drag EZ-Grab.

You copy the data from your source, then press the EZ-Grab button, paste
it, set the format of the columns, then import it to your file.

Joe M.

Hello,

If you will follow the directions I sent you and assuming you have a premium subscription membership for Radio Reference then you do not need EZ grab.

Don, KE4JD

Hello,

What you want to do is not automatic. It's easy but not automatic.

You will need to make sure your scanner and computer are communicating first. Since you have an integrated serial port this should only be a matter of selecting the correct serial port in Freescan.

Click Scanner -> Control Scanner

Click on Comport Setup and choose one if you have more that one listed there. Then click on Start Virtual Control (assuming your scanner is connected and turned on) and you should see the display mirrored in the

display on the screen. Or you can click on Start Auto from Comport Settings and it should detect your scanner automatically.

Once you are communicating with your scanner close those windows so that you are just looking at the main program window

Click File -> Import -> and then click either Radio Reference Conventional or Radio Reference Trunking. If you don't know the difference then you will need do some reading on RadioReference. com or your CD manual or Uniden's Twiki for the BCD396XT.

Once you do that and understand the difference, click Radio Reference Conventional or Radio Reference Trunking.

Assuming for discussion purposes you selected Radio Reference Conventional then you will see the Radio Reference Import screen.

Enter your Radio Reference username and password.

Then click Connect. If you connect successfully you will see Country in the left drop down box. If you are in the USA click the US flag.

Then click the Province/State drop down box and select your state.

The you can either click on the County drop down box and select your county or the Province/State Agencies drop down box and select a system there.

If you click on County select your county.You should the see the Groups tab populate with different conventional systems in your county.

You should see a few groups with check marks in the the boxes on the left. If you leave them all checked you can click the IMPORT button and they will be loaded into the left hand text box on the main screen of the program. When you are through with Conventional systems close this window.

Repeat this for the Trunking systems you might be interested in.

After you have populated this list with what you want to listen to there is one more important step before you send them to the radio.

Again, we are looking at the main program screen and text box on the left side that has the systems you have selected.

Click on each Conventional and Trunking system. In the panel to the right click the Quick Key drop down box.

There should be a list from 0 - 99 there. I suggest that you use 0 - 9 right now. Put conventional systems in one Quick Key and each trunking system in other Quick Keys between 0 and 9. If you have more systems than Quick Keys just put them in the same Quick Key as others. This way all the systems you program will be available in the first 10 System Quick Keys and can be selected or deselected by pressing digits 0-9. This is not optimal ultimately but is an easy way to start.

After you set Quick Keys for your systems you are ready to send the systems to the scanner. There are numerous other steps that you could take like selecting Group Quick Keys but you can learn about those after you are listening to things.

Now click on the button at the top that has a scanner and an up arrow on it.

You should see "Send to scanner" at the top of the window that pops up.

Click the Check All button. There are several other items that can be checked but you don't need to do so at this time.

Now click the Load Programming button and the software will send the systems you have selected to your scanner (assuming of course that you have made sure that the computer and scanner are communicating as explained above).

The little graphic below the button will be animated while the process is going on and when you are done a check mark will appear by the scanner and you will be done.

There is a lot more to it than this and I have left out some things that you will ultimately want to change but this should get you started.

Hope this helps,
Don, KE4JD

EZGrab is not a drag and drop type function. It
is rather a copy and paste type function in which
you copy data to the clipboard and then paste it
into FreeScan. It would probably be helpful if
you were to look at the FreeScan Users Guide
which includes lots of illustrations of how to do
things such as EZGrab. You'll find it in the RadioReference wiki at

http://wiki.radioreference.com/index.php/FreeScan_User_Guide

Topic: 3692 Message: 3720

Yes, the "labeled" ones are the ones saved/stored to a group and with alpha tags.

The TGs that are not transferring are ones in their "generic" or default state so to speak. They are not stored or saved anywhere. I do the permanent L/O on them since I'm not interested in them and that way I won't run up the limit for the saved and alpha tagged TGs for that system.

Hopefully I'm explaining it correctly.

BTW and just in case you missed it, Assaf responded about this: "In FreeSCAN, if they are not saved to a group, they won't get downloaded. But the next version will fix this."

On Feb 13, 2010, at 10:58 AM, Paul Opitz wrote:

> By "labeled ones" do you mean only the ones you have stored in channels? Or do you have some TGIDs stored in channels with their default names and those are the ones that are not transferring?

This is fairly common with simulcast systems. If you are located in an area that receives signal from two (or more) simulcast transmit sites, the signals arrive slightly out of phase and this causes destructive interference.

Turning on the attenuation feature of your scanner MIGHT help somewhat. If not, you'll probably have to live with it until the system techs get arouind to tweaking the timing of the sites since the interference will likely be affecting the official users in your area as well (even with their expensive radios).

Don't hold your breath though, if it is like the Indiana SAFET system it may or may not get fixed, and in case of some sites it may get a whole lot worse. For months the system was getting better, but now with rebanding going on it's gotten worse as has the 'motorboating" with some sites. Oh, and the GRE's are not immune from it either so don't bail to them thinking it will fix the problem. You could try a beam antenna aimed at the site you prefer, since it is directional it may help your situation and it is quicker than waiting on techs to catch up.

John

Ordered a BCD396XT this weekend, and am reading the manual until it arrives. Question: I live in Kansas and wonder if I can listen to a TGID from my home town on the statewide system anywhere in the state?

[Message title changed to make sense with topic change]

Normally, no.

Statewide (and other large area multisite) systems use "Smartzone" methods to ensure that traffic on the system is efficiently handled. When a user transmits, his communication is only repeated on sites where a radio also assigned to their TGID (channel) has affiliated. So, it would be unusual for a Wichita comm, for example, to be heard in Topeka. If a Wichita unit drives up to Topeka with their radio on, however, their radio will affiliate with a Topeka site, and then you'd hear Wichita comms on that site until that unit was no longer affiliated.

If all comms from every talk group on a statewide system were repeated at all sites, each site would eventually need hundreds of voice paths (frequencies) to handle all the traffic.

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-02-23 02:41:07 UTC
From: Richard Silagi
Topic: 3724 Message: 3731

I was going to say the same thing. I know many systems that have gone on sounding like crap for years even with the users complaining themselves. Many times the radio manufacturer will spec a system and then the customer will want to cut cost and trim little bits here and there. Then when it is installed they realize the performance is not what it should be, and then they waste months or years trying to Mickey Mouse a fix for it.

Subject: Re: [BCD396XT] simulcast digital system

Don't hold your breath though, if it is like the Indiana SAFET system it may or may not get fixed, and in case of some sites it may get a whole lot worse. For months the system was getting better, but now with rebanding going on it's gotten worse as has the 'motorboating" with some sites. Oh, and the GRE's are not immune from it either so don't bail to them thinking it will fix the problem. You could try a beam antenna aimed at the site you prefer, since it is directional it may help your situation and it is quicker than waiting on techs to catch up.

This is fairly common with simulcast systems. If you are located in an area that receives signal from two (or more) simulcast transmit sites, the signals arrive slightly out of phase and this causes destructive interference.

Turning on the attenuation feature of your scanner MIGHT help somewhat. If not, you'll probably have to live with it until the system techs get arouind to tweaking the timing of the sites since the interference will likely be affecting the official users in your area as well (even with their expensive radios).

No, it doesn't quite work that way. Individual radios affiliate with a specific tower, and that tower will only broadcast the talkgroups that have radios affiliated with it. So if there are no system radios affiliated with the ocal tower on your favorite talkgroup you won't hear the traffic.

Occasionally however units travel around the state and may affiliate with their home talkgroups on remote towers, then you would hear them.

Unless they are programmed to broadcast system-wide (very unlikely), you
will only hear them in areas where there are units who are affiliated
with that TG. (IOW, for the most part only on sites where that channel's
cars are in range)

Did I explain that well enough?

Default setting is "2" which works for most.

While written about CB, the following article has a pretty good explanation of what squelch is all about (and it applies to bands other than CB).

It opens at low numbers (usually 1 for me) and higher is tighter (which means it takes a stronger signal to overcome it).

As Paul suggested, I've found that a setting of '2' works fine for me.

In general, you want to lower it on a CSQ channel until it opens (makes noise), then raise it until it just stops. Note this will not work on a CTCSS/CTCSS/NAC protected channel, or on a trunk system. You have to set it on a channel that is not using any means of guarded access. If you just hit HOLD-(FREQ)-HOLD, that will work fine.

I'm guessing you probably could if the one TG is being used by someone very close by AND you are also close by or near that tower/site. Like the reply says. So if someone with a certain TG is running an errand (lets say) two counties over and needs to use the radio back home you will hear it on the tower(s) where the radio is being used and the towers back in the original county. Not all over the state. You can't program one TG and go all over the state and listen to it.

No, the scanner hardware does not include a real-time clock, so this kind of feature isn't implemented. Some short timed events (like system hold time, channel hold time, etc) can be done without such a timer, but it can be pretty imprecise (but not really noticed for short timing events).

No. Why would you think a portable scanner would have an auto-off timer?
I mean, it does shut off if the battery gets low, but no timer.

If you power it with a wall wart, you can buy a timer to
turn that off which will in turn shut the scanner down.

For the mobile, I would agree since it's a hardware switch. But for the 396, it's software and a "power off" command is certainly possible.

As for your cellphone, I bet that's time-based, and as the scanner has no clock...

It would be possible for a crude "shut off in X minutes or X hours" timer to be added, but is there really that much demand for the feature? (especially in light of viable aftermarket alternatives)

You just need to obtain a USB to Serial Port converter with a male
adaptor for the RS-232(DB-9) connection.

The jack is meant for headphones and not to drive a speaker. Pick up an amplified 12w Motorola speaker.

What gives is the fact you plugged it into an earphone jack and not an external speaker jack. For earphone jacks, you need an amplified external speaker, and I bet your Kenwood speaker is not amplified.

GPS controls the Temporary Lock/Unlock status. If no GPS is connected, all GPS controlled elements will be unlocked when you cycle power.

It does not remember your last location when you cycle power.

I use Startup Keys to quickly lock / unlock specific configurations for fixed locations.

Only if you enable Control Channel Only, and there is no need to keep
the non-control channels - you can just delete them, but be sure to keep
any that are control channels for that site (PRI and ALT).

Hi Paul,

Curiosity has gotten me on this one. I have been setting up GPS elements for some time, but have not used the GPS feature ***YET***. You mention that all GPS controlled elements will be unlocked when you cycle power. Based on the GPS controlling the temporary lock/unlock feature, would you possibly have meant the scanner will return to its locked/unlocked settings prior to the GPS use? I may have read into the answer, but I don't want the GPS unlocking systems that were locked prior to the GPS usage.

Thanks,
Dewey

If you start wil all elements unlocked, plug in a GPS, all out of range elements will be temporarily locked. If you then turn off power, remove the GPS, and turn power back on, everything will be unlocked.

If you start with all elements locked, plug in a GPS, all in-range elements will be unlocked. If you then turn off power, remove the GPS, and turn power back on, those elements unlocked by GPS will remain unlocked. Those "untouched" will remain locked.

If you start with all elements locked, plug in a GPS, all in-range elements are unlocked. Then, drive to another location that results in some additional elements being unlocked and some previously unlocked elements being locked. If you then turn off power, remove the GPS, and turn power back on, all elements unlocked by the GPS at any time during that session will be unlocked (since those that it unlocked, then later locked were temporarily locked).

I bought a universal cradle with a goose-neck mount that attaches to the passenger seat bolt like this one:

http://amzn.com/B000IR6T2S

And it looks like they make a suction mount version too for the windshield:

http://amzn.com/B000BFHEFI

If you use either of these, you'll most likely have to unscrew the belt-clip swivel off the back of the scanner as I had too.

Another alternative would be to get some peices from pro-clip for your specific vehicle and use the mic mount like John recommended:

http://www.proclipusa.com/

But in my experience, the proclip stuff may not handle the weight of the 396 very well - but at really depends on the specific mount due to the way they attach to the car - some work better than others.

The antenna fits in one end of the slot and the bottom pops in the bottom vertically. I think it is designed to be used horizontal with the GPS unit. I've never had a problem with the suction cup coming loose from the window either.

Thanks Michael! That's exactly what I'm looking for. Are you attaching the mount to the BCD396XT's swivel clip or to the scanner itself?

I have one of these and it works great. It's actually a GPS mount but happens to fit the 396. Available at Radio Shack. Check out the link below.

I use a mic hanger with automotive double-backed tape (double sided) on
my dash so my antenna is sticking up above the top of the dash.

I'll have to get a pic of it.

There's also a guy on ebay that sells scanner cradles. I believe he has a vent cradle, passenger seat neck mount, and a suction cup.

To: BCD396XT@yahoogroups.com
From: richardyoo@...
Date: Tue, 2 Mar 2010 18:02:27 -0600
Subject: Re: [BCD396XT] Mount for BCD396XT?

I bought a universal cradle with a goose-neck mount that attaches to the

passenger seat bolt like this one:

http://amzn.com/B000IR6T2S

And it looks like they make a suction mount version too for the windshield:

http://amzn.com/B000BFHEFI

If you use either of these, you'll most likely have to unscrew the belt-clip

swivel off the back of the scanner as I had too.

Another alternative would be to get some peices from pro-clip for your

specific vehicle and use the mic mount like John recommended:

http://www.proclipusa.com/

But in my experience, the proclip stuff may not handle the weight of the 396

very well - but at really depends on the specific mount due to the way they

attach to the car - some work better than others.

I believe the speaker or audio amplifier circuit has failed in my 396XT.

The audio was sounding scratchy/distorted at volumes over 8 for about 5 minutes or so, then the speaker cut out. Plugging into the headphone jack gives me good, clean audio.

I was able to get the speaker to work twice by running the volume up and down from 0 to 15 a few times. It would sound distorted, then cut out again above a volume level of 7 or so.

I did try leaving the batteries out overnight to see if that helped, it worked for a few seconds then cut out again.

It sounds like an amplifier circuit has an intermittent connection problem since the speaker worked for a short time and then stopped again. I would contact Uniden (perhaps we'll get a message from someone who works there?) and describe the symptoms. I haven't had the courage to open mine and see how much division of labor there is, but I would suspect that most, if not all of the circuitry is on one board. I mean there's only so much room...

Sincerely,

Richard Fredrick

Delay is set at the system level. All channels in the system share
the same delay setting.

> Thank You

No the delay applies to all talkgroups or conventional frequencies in that system. It is not a problem with the software to create separate systems that require a different delay times.
For example by setting the hold time to 0 for a system the radio scans the system(s) with no hold time so setting one system to delay -10 and another with 2 is not a problem.

Hello,

Just wondering if anyone on the group uses a laptop with a USB to serial adapter to program their BCD396XT? I have a laptop without a serial port and would like to get a usb adapter that would allow me to program my radio. Next question is would anyone know of one that is sold online for less than $15 that supports Win98 thru Windows 7 64bit? I currently have Windows Vista 32bit but I would like to upgrade in the future to Windows 7 64bit and would like to have a adapter that will work with it. Anyone know of a adapter that will work?

Thanks,

Joey

I've been using the IOGEAR GUC232A adapter for years now without problems. It works equally well on Windows or Mac. The only thing is most of those adapters are usually between $20-30. You might be able to get them cheaper on eBay. YMMV.

Subject: RE: [BCD396XT] Re: USB to Serial Adapter

Hello,

Just wondering if anyone on the group uses a laptop with a USB to serial adapter to program their BCD396XT? I have a laptop without a serial port and would like to get a usb adapter that would allow me to program my radio. Next question is would anyone know of one that is sold online for less than $15 that supports Win98 thru Windows 7 64bit? I currently have Windows Vista 32bit but I would like to upgrade in the future to Windows 7 64bit and would like to have a adapter that will work with it. Anyone know of a adapter that will work?

Thanks,

Joey

I've owned many scanners over the years but the "Quick Keys" on the last few models of the Uniden devices have me a little baffled.

Can I assume that the "quick keys" on the 396XT and the 996XT operate the same?
The "quick keys" can be used at a system and a Group level for including or excluding stuff? Can the "quick keys" be assigned to a system, a group, and a frequency simultaneously? Let's say I have 20 systems with 20 groups in each system.
If I assign a quick key to a system will all the groups in the system be controlled by that key? If I was scanning 20 systems and heard something on one system that I wanted to listen to would I need to "lock out" the remaining 19 systems or is there another way to scan just one system or group?

I have used several different models, including the Aten and IO Gear.

You can also use the USB-1 USB programming cable ($19.95 from
Scannermaster). Just be sure to download the proper driver for your
version of Windows from the ScannerMaster website.

Yes

>The "quick keys" can be used at a system and a Group level for
>including or excluding stuff?

Right

>Can the "quick keys" be assigned to a system, a group, and a
>frequency simultaneously?

The System/Site Quick Keys (SQKs) for conventional systems are at the system level, but for trunking systems, they are at the site level.

There are also Group Quick Keys at the group level of both conventional and trunked systems.

There are no frequency quick keys.

>Let's say I have 20 systems with 20 groups in each system. If I
>assign a quick key to a system will all the groups in the system be
>controlled by that key?

Yes. Toggling that SQK will toggle the entire system active/inactive.

>If I was scanning 20 systems and heard something on one system that
>I wanted to listen to would I need to "lock out" the remaining 19
>systems or is there another way to scan just one system or group?

If you press and hold the Hold key, it will be in System Hold and will stay on that system. You could then use the GQKs to narrow down the particular group that you wanted to stay on.

You can have 100 different SQKs, but each system only has 10 GQKs. You can assign more than one system/site to a SQK and more than one group to a GQK.

There's a wiki article here that may be helpful:

http://wiki.radioreference.com/index.php/Systems,_Sites_and_Groups

Before you decide on which adapter or cable with built-in adapter (USB-1) you want to buy, make sure that you can find the necessary drivers for that adapter/cable and Windows 7 64 bit. Install the appropriate driver before plugging in the adapter or cable.

I have used the Cables Unlimited USB-2920 from Newegg which retails for $16.99 on almost all of the operating systems that you can imagine, even on the server platforms. What I like about it is that it doesn't have extra cable making it longer, just a USB on one end, and a DB9 connector on the other. And yes, I have used this on numerous laptops also, from my 2 Dell laptops, to my Asus eeePC Netbook.

Thank You the answer.

My reason for asking is on the pro-97 I could put in freqs and then use the delay option (per frequency) to know whether I had heard that freq and then update the files at home later.

So is there a way to tag/mark a single frequency fairly easy out in the field to be able to tell if I had or had not heard any freqs to upload to FreeScan at home later?

--- In BCD396XT@yahoogroups.com, "hrsfoto" <forrest@...> wrote:
>
> I will have my BCD396XT next Thursday. I have had a pro-97 for many years. I am also trying/using FreeScan. I know there is a 'delay time' that affects all freqs in a conventional system. Where or how can I have a delay on/off for individual freqs in a group?

Date: 2010-03-10 20:04:01 UTC
From: Cliff B
Topic: 3815 Message: 3815

I've listened to the web-accessible broadcasts of my local police for a few years and enjoy that. I also occasionally listen to web-based airline traffic in our area. So I've started toying with the idea of getting a scanner, and the BCD396XT seems to be a popular one. Keeping in mind that I've never owned, much less programmed, a scanner before, is this a good unit for me to purchase? I assume it will have no trouble being picking up my local (Thornton, CO/Denver, CO/Boulder, CO) police traffic, at least once it's programmed. But what I don't know is if it will actually pickup the airline communications from Denver International Airport and incoming/outgoing planes. So as a starting point, thought I'd ask about it here.

For specific advice on your area, you might also want to ask in the Colorado forums at RadioReference.com.

For air band traffic, in general you can receive the air side of the traffic across a wide area. The ground controller side is typically receivable only from relatively nearby locations (unless you are on a hill or in an airplane). Unlike land radio services, where the antenna is placed on a very tall tower in order to provide a large ground footprint, air traffic control antennas are typically not much higher than ground level, as their targets for reception are at high altitude.

The BCD396XT is a great and fun to use scanner. For a new scanner user keep in mind that all of the
new scanners are complicated and require perseverance to learn. It's not just the scanner but the technology of trunking (Motorola, LTR and EDACS to name the most popular). Not to scare you away
from the hobby but the learning process is searchable . Programming the scanner by
software programs is almost a must. http://scannow.org/

I prefer the Uniden method of using the memory as it is the most versatile to access systems whether
conventional or trunked as a scenario changes.
As Paul has mentioned, air traffic might require an external mounted antenna such as the Scantenna
or the Antennacraft ST2 (I think both are the same).

Go here http://www.radioreference.com/ and here http://forums.radioreference.com/colorado-radio-discussion-forum/

Good luck, Clark

Hi Cliff!

The 396XT is a great scanner! You should be aware, though, that there will be a definite learning curve which has intimidated a number of people on this list in the past. You should be prepared do to a little work to get it up and running and fine tuned to your liking. If you get it, I would seriously recommend you look at a subscription to Radio Reference. It is a really great resource. It is not a beginners level scanner in terms of simplicity. It is probably the BEST scanner you can get as far as features and capabilities are concerned. You should not have trouble with aircraft reception provided you are in the general area of the planes. You will hear much more plane to ground than ground to plane unless you are within a few miles of the airport itself.

Good luck! :-)

Cliff, Your next question might be where to buy.....
My recommendation is http://www.usascan.com/files/scanners.html
as I have purchased several scanners from them, all with timely service.
The BCD396XT is $499.95 delivered.
I'm sure that others will recommend other dealers.

Good time, good food last night.

The weather site I mentioned is weather underground (http://www.wunderground.com) I pay $5.00 a year to get rid of the advertisements. In the upper right hand corner you can click on “Full Screen” which is new and gives a nice detailed local view.

The other one you want to download is Google Earth (earthgoogle.com). Lots of fun with it.

Have a good trip.

Hi Cliff!

The 396XT is a great scanner! You should be aware, though, that there will be a definite learning curve which has intimidated a number of people on this list in the past. You should be prepared do to a little work to get it up and running and fine tuned to your liking. If you get it, I would seriously recommend you look at a subscription to Radio Reference. It is a really great resource. It is not a beginners level scanner in terms of simplicity. It is probably the BEST scanner you can get as far as features and capabilities are concerned. You should not have trouble with aircraft reception provided you are in the general area of the planes. You will hear much more plane to ground than ground to plane unless you are within a few miles of the airport itself.

Good luck! :-)

Scott

Subject: [BCD396XT] Considering a purchase of one of these...

I've listened to the web-accessible broadcasts of my local police for a few years and enjoy that. I also occasionally listen to web-based airline traffic in our area. So I've started toying with the idea of getting a scanner, and the BCD396XT seems to be a popular one. Keeping in mind that I've never owned, much less programmed, a scanner before, is this a good unit for me to purchase? I assume it will have no trouble being picking up my local (Thornton, CO/Denver, CO/Boulder, CO) police traffic, at least once it's programmed. But what I don't know is if it will actually pickup the airline communications from Denver International Airport and incoming/outgoing planes. So as a starting point, thought I'd ask about it here.

The quick way to load the 396 is to purchase Butel Software's ARC XT program $62 and also as said Radio Reference. Both will get you up and running.

$5 a year also gets you enhanced radar views (animate up to 40 radar snapshots instead of IIRC max 5), stored site preferences, and probably some more goodies I don't immediately recall.

Thanks to all of you that replied here...I'll definitely start doing more research and reading. I'm already slightly familiar with RadioReference.com as that's where I access my online police traffic from. I appreciate all the help, and will hopefully back one day soon to ask for more input on my purchase!

Thanks,
Cliff

Is there a way to tag/mark a single conventional frequency fairly easy out in the field to be able to tell if I had or had not heard that frequency to upload to FreeScan at home later?

You could toggle either the attenuation state or the IFX state (HOLD, then F+7 or F+4).

OK. I can see where attenuation would show up in FreeScan but I can't seem to find where IFX state would show. My BCD396XT is on the UPS truck to be delivered today

Oops, you are right. IFX affects the scanner at the frequency level, not the channel level (i.e. if you use IFX on a channel programmed to 123.45 MHz, it will affect all channels programmed with 123.45 MHz...as well as any searches). I have no idea where or if Freescan tracks that.

Use ATT.

There's a list of the frequencies that are subject to the IFX on the
Frequencies tab in the Scanner --> Set Scanner Options screen.

You could also use the volume offset and that even gives you 6 values
other than the default of 0 so that you could assign some type of
code perhaps to your tag/mark.

By any chance are you related to a Richy Victor that was an ABC-TV director in Chicago at WBKB or later at WLS-TV during the 1970's.

I am trying to find people from that era.

3834. Default setting for 'Tone'

Yahoo group: BCD396XT (2008 — 2010)
Date: 2010-03-15 04:27:46 UTC
From: hrsfoto
Topic: 3834 Message: 3834

Is there a way (in FreeScan) to have the default setting for 'Tone' CT and PL to be 'Search' instead of 'None'? - normal conventional scanning - so as to not have to manually do it for every channel. Most of the freqs in my area are conventional with surrounding areas going trunked and then of course when I travel there are a lot in the big citys.

3835. Re: [BCD396XT] Default setting for 'Tone'

You can change parameters as a group in FreeScan by highlighting the channels that you want to change using the standard Windows conventions such as Ctrl-A, Crtl-Click, or Shift-Click. Then if you hold down the Ctrl key, make the change that you want applied to all of the marked channels, and hit enter, it will make the change for all of them. It's harder to describe than it is to do it.

It's not a default setting as such, but it sure beats doing them one at a time.

Keep in mind that if you set the tone to Search, you will be setting those channels' audio type settings to analog only.

Thank You very cool! It is easy after doing it a couple times. So far I'm still working with conventional frequencies.
